5. Why did you reach the decision above?

(1)_____ Child is not interested in further education
(2)_____ Child's grades are not good enough
(3)_____ Child's vocational choice doesn't require past high school training
(4)_____ Colleges don't offer appropriate training for child's vocational choice
(5)_____ Lack of finances (just can't afford it)
(6)_____ Other (specify)_____

6. If a community college were available in the area so that your child could live at home and commute to school, would this change the probability that he or she would go on to school?

(1)_____ Yes
(2)_____ Probably
(3)_____ Not likely
(4)_____ No

7. If you feel that your 11th grade child will attend some form of education after high school, what type of program would you expect him or her to take?

(1)_____ Accounting
(2)_____ Advertising
(3)_____ Agriculture
(4)_____ Architecture
(5)_____ Art
(6)_____ Athletics
(7)_____ Beautician or Barber
(8)_____ Building Trades
(9)_____ Business Management
(10)_____ Chemist
(11)_____ Conservation
(12)_____ Dental Hygiene
(13)_____ Dentistry
(14)_____ Drafting
(15)_____ Dramatics
(16)_____ Electronics
(17)_____ Engineering
(18)_____ Finance
(19)_____ Government Service
(20)_____ Homemaking

(21)_____ Hotel Management
(22)_____ Industrial Worker
(23)_____ Journalism
(24)_____ Laboratory Technician
(25)_____ Law
(26)_____ Law Enforcement
(27)_____ Mathematics
(28)_____ Mechanics
(29)_____ Medical Technician
(30)_____ Medicine
(31)_____ Metal Trades
(32)_____ Mortuary Science
(33)_____ Music
(34)_____ Nursing
(35)_____ Occupational Therapy
(36)_____ Pharmacy
(37)_____ Photography
(38)_____ Psychology
(39)_____ Religion
(40)_____ Retailing
(41)_____ Salesman
(42)_____ Secretary or Stenographer
(43)_____ Social Work
(44)_____ Teaching
(45)_____ Veterinary Medicine
(46)_____ Other (specify)_____

8. If Hillsdale County is served by a community college offering the first two years of college work as well as specialized training programs (technical, business, vocational), would your 11th grade child be likely to attend this institution after high school?

(1)_____ Yes
(2)_____ No
(3)_____ Uncertain

9. If Hillsdale County is served by a community college, in what additional education, if any, would you yourself be interested?

(1)_____ None
(2)_____ Work on high school diploma
(3)_____ Work on college degree
(4)_____ Courses to help in my job or help to get a better job
(5)_____ Courses to help me improve my home
(6)_____ Courses to broaden myself
(7)_____ Other (specify)_____

10. If it were necessary to join with another county to establish a community college that would service Hillsdale County, which county would you prefer to join with? (Place a 1 before your first choice, a 2 before your second choice, and a 3 before your third choice.)

(a)_____ Branch
(b)_____ Jackson
(c)_____ Lenawee

11. If a community college were not feasible at this time, how would you suggest that additional training/education be provided?

(1)_____ Technical-Vocational center
(2)_____ Additional night courses at high school
(3)_____ Other (describe)

12. If a community college is established in this area, would your other children be likely to attend?

(1)_____ Yes
(2)_____ No
(3)_____ Uncertain
(4)_____ Will not attend college
(5)_____ Will attend college or school elsewhere
(6)_____ No other children

Curriculum Distribution of Juniors

Curriculum	Number	PerCent

2. How well do you feel you were prepared in school for this occupation?

Very Well	66	12.15%
Acceptably	193	35.5%
Inadequately	124	22.8%
No preparation necessary	148	27.25%

3. Do you feel that additional occupational training is necessary for your work?

Yes	239	44%
No	297	54.7%

4. If it were possible to obtain additional training locally, would you avail yourself of it?

Yes	412	75%
No	117	21.5%

5. If your answer to question 4 is yes, check the areas of study, listed below, that you would be most interested in pursuing.

62	Accounting (15%)
30	Agriculture (7.28%)
12	Architecture (2.9%)
24	Art (5.8%)
19	Athletics (4.6%)
24	Beautician or Barber (5.8%)
86	Building Trades (Mason, Carpenter, Electrician) (20.8%)
96	Business Management (23.3%)
12	Chemist (2.9%)
45	Conservation (10.9%)
5	Dentistry (1.2%)
78	Drafting (18.9%)
5	Dramatics (1.2%)

63	Electronics	(15.3%)
82	Engineering	(19.9%)
37	Finance	(8.98%)
23	Government Service (Post Office, Library)	(5.6%)
12	Homemaking	(2.9%)
53	Industrial Worker	(12.9%)
6	Journalism	(1.45%)
14	Laboratory Technician	(3.4%)
24	Law Enforcement	(5.8%)
92	Mathematics	(22.33%)
80	Mechanic	(19.4%)
9	Medicine	(2.2%)
156	Metal Trades (Tool and die, Machinist, Welding)	(37.9%)
13	Music	(3.2%)
2	Pharmacy	(0.5%)
9	Photography	(2.2%)
32	Psychology	(7.8%)
13	Religion	(3.2%)
9	Retailing	(2.2%)
24	Salesman	(5.8%)
21	Secretary	(5.1%)
15	Social Work	(3.6%)
0	Other (specify)_____	

6. How could this additional training best be provided?

a.	199	Additional night courses at high school	(48.3%)
b.	121	Community college	(29.4%)
c.	115	Vocational center	(27.9%)
d.	43	Other (specify)_____	(10.4%)

As you may know, a citizen's study group has been set up under the direction of Hillsdale County Intermediate School District. A part of the study is concerned with the vocational needs in the community, particularly as it relates to additional training in the technical vocational area. Thank you for your help in completing this questionnaire.

APPENDIX C

Questionnaire Submitted to Management and Professionals (Results Included)

April 28, 1966

Dear Sir:

The Hillsdale Vocational Educational sub-committee is conducting a survey in conjunction with the community college study to determine the amounts and types of vocational-technical education needed in this area.

Enclosed is a questionnaire in an attempt to seek information from industry, business and agriculture relative to the type of education and training you require for initial employment in your establishment.

Will you please fill out the form and check only those areas that pertain to your business or industry. We particularly call your attention to the last page of this form.

Information furnished by you will be most important for the training of your future employees and very necessary in planning for adequate vocational-technical training for all youth of the Hillsdale Area Vocational Educational study.

Your cooperation will be greatly appreciated and all information will be treated as strictly confidential. In the interest of time, we would appreciate the return of the questionnaire by Friday, May 6th. Thank you.

Sincerely,

Frank Leutheuser
Bruce Sutherland
Business Industry Representatives

HILLSDALE AREA VOCATIONAL-TECHNICAL STUDY

Business, Industry and Agriculture Survey

Introduction: The purpose of this questionnaire is to gather information and opinions from business and industrial employers to use in improving educational programs for employment-bound youth in the Hillsdale County area. You can help by completing the questionnaire as completely as possible. The results will be used for statistical analysis and your firm will not be identified in any published reports.

Special Note: Except for large firms, the completion of the questionnaire will require only a few minutes. Study the heading of each section. If it is applicable to your firm, please check or fill in the information; if not, proceed to the next section.

General Information

1. Firm Name _____

2. Mailing Address _____

3. Name of Person Reporting _____

4. Your Job Title _____

5. Telephone Number _____

(73 Returns)

6. Please check the space opposite the description which best identifies the activities of your firm. Check more than one if needed.

PART IV - Employer Opinion and Practice

A. With respect to the requirements of your firm for entry employment, in what job categories do you employ young persons who have "dropped out" without finishing high school? Please put check marks under the headings which best describe your firms operating policies.

Entry Job Category (Percentages are in parenthesis)	Frequency of Employment		
	Common Practice (1)	Infrequently (2)	Almost Never (3)
1. Highly-skilled jobs	1 (1.36)	0	6 (8.21)
2. Business Office jobs	1 (1.36)	3 (4.10)	10 (13.69)
3. Sales jobs	1 (1.36)	2 (2.73)	7 (9.58)
4. Apprenticeship for the highly-skilled trades and crafts	3 (4.10)	6 (8.21)	7 (9.58)
5. Semi-skilled jobs (assembly line and production workers, machine operators)	10 (13.69)	6 (8.21)	3 (4.10)
6. Service jobs	6 (8.21)	8 (10.95)	4 (5.47)
7. Unskilled labor	15 (20.54)	8 (10.95)	3 (4.10)

B. With respect to the requirements of your firm for entry employment, in what job categories do you employ young persons who have graduated from high school? Please put check marks under the headings which best describe your firm's operating policy.

Entry Job Category	Frequency of Employment		
	Common Practice	Infrequently	Almost Never
1. Technician jobs	5 (6.84)	4 (5.47)	1 (1.36)
2. Highly-skilled jobs	5 (6.84)	2 (2.73)	2 (2.73)
3. Business office jobs	18 (24.65)	4 (5.47)	1 (1.36)
4. Sales jobs	10 (13.69)	0	1 (1.36)
5. Apprenticeship for the highly-skilled trades and crafts	11 (15.06)	5 (6.84)	1 (1.36)
6. Semi-skilled jobs (assembly line and production workers, machine op)	18 (24.65)	2 (2.73)	0
7. Service jobs	12 (16.43)	4 (5.47)	0
8. Unskilled labor	15 (20.54)	3 (4.10)	0

C. Recalling the employing practices of your firm for the past five-year period, which one of the following statements best describes your evaluation of young persons who have applied for entry jobs with your organization? Please check one in each category.

1. DROP OUT

12 (16.43%) (a) We have employed a number of young non-high-school graduates; and we have found they can perform satisfactorily in the following jobs: (specify)

_____

_____

9 (12.32%) (b) We have employed a number of young non-high-school graduates; but find they need a considerable amount of additional education and/or training before they can perform satisfactorily.

11 (15.06%) (c) We have found young non-high-school graduates unsatisfactory for the following reasons:

_____

_____

2. HIGH SCHOOL GRADUATES

27 (36.98%) (a) Most young high school graduates who apply seem reasonably well prepared for entry employment, and we have employed them as openings have occurred.

16 (21.91%) (b) We have employed a number of young high school graduates, but find they need a considerable amount of additional education and/or training before they can perform satisfactorily.

0 (c) We have found it inadvisable to employ young high school graduates, except for unskilled jobs.

5 (6.84%) (d) The nature of most of the entry jobs in our firm is such that young high school graduates are virtually unemployable because of a lack of occupational education and training.

D. To what extent do existing educational facilities in the Hillsdale County area meet the occupational and training needs of your company or firm?

7 (9.58%) (1) Very Well 29 (39.72 %) (2) Fairly Well 18 (24.65%) (3) Poorly

E. If you think occupational education and training in the area need improvement, which of the following developments would you support? (Please check, more than one if you like)

28 (38.35%) (1) Substantial expansion of vocational education programs in the existing high schools.

18 (24.65%) (2) Creation of an area vocational school(s) for secondary (high school) occupational training.

13 (17.80%) (3) Establishment of a strong program of occupational education in a post-secondary institution.

F. Would you and your firm be interested in participating in discussions or further study of plans for improving occupational education and training at high school and post-high school levels in Hillsdale County area?

19 (26.02%) (1) Yes 14 (19.17%) (2) No 23 (31.50%) (3) Undecided

G. Is there a formally organized training program in your company or firm?

18 (24.65%) (1) Yes 38 (52.05%) (2) No

H. If "Yes", please check each type of program you now operate on a formal basis.

25 (1) Apprenticeship (138.88%)
9 (2) Supervisory training (50.00%)
6 (3) Technician training (33.33%)
1 (4) Plant management (5.55%)
4 (5) Job upgrading (22.22%)
2 (6) Executive development (11.11%)
2 Other (write in below) (11.11%)
____ (7) ____

Questionnaire Submitted to High School Principals

HILLSDALE AREA VOCATIONAL-TECHNICAL STUDY

FACILITY USAGE

Please list the rooms used for vocational or pre-vocational classes in your junior and senior high school. This would include vocational shops, industrial arts, business, home economics and agriculture, or any room which may be serving a dual purpose.

List the name of the prime use of the room on the left and the maximum number of students that it will accomodate on the right. Place the number of students enrolled in each period of the day in the appropriate column.

Name of Room	Period of Day 1	2	3	4	5	6	7	Adult	Summer	Maximum No. Facility Accomodates
Drafting										
Woodworking										
Typing										
Home Economics										
Agriculture

Fulmer, John L.
Analysis of Occupational Trends in Kentucky From 1950 to 1960 with Projections to 1975.

Kentucky Univ., Lexington. Bureau of Business Research
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 65 67p.

*EMPLOYMENT TRENDS; EMPLOYMENT LEVEL; *EMPLOYMENT STATISTICS; *LABOR FORCE; *EMPLOYMENT PROJECTIONS; OCCUPATIONAL CLUSTERS
KENTUCKY

Objectives included the (1) determination of occupational trends for Kentucky for 1950-60 and a comparison of them to the U.S. trends, and (2) preparations of projections of probable yearly demands for different types of skilled, clerical, and technical workers. Only the main occupational categories in the 1950-60 Census of the Population were studied. A basic assumption was that the state's current rate of growth in employment and output of goods and services would not only be sustained but accelerated in the 1970's. The 1965-75 projections indicate an increase of 111,300 (30 percent) white collar jobs and an increase of 76,600 (13 percent) blue collar jobs. An increase of 38,900 (38 percent) in professional and technical jobs, and an increase of 36,600 (31 percent in clerical occupations account for the largest increase in specific white collar groups. The only projected decrease was 18,300 (15 percent) in farm jobs. Trends indicated (1) Occupations in Kentucky had lower percentage increases or higher percentage declines than the national average and (2) Employment shifts from 1950-60 resulted in a net loss of 87,000 jobs for men and a gain of 69,000 jobs for women. ACKNOWLEDGEMENTS

This report was prepared on a short time schedule in order to meet urgent pressures for a generalized outlook on occupations in Kentucky. It, therefore, could not have been possible without the highest form of cooperation from many persons on the Bureau of Business Research Staff. The author wishes to acknowledge especially the assistance of the following persons: Messrs. William D. Bishop and Jack M. Davis who prepared the numerous calculations, and Davis, the charts also; Mrs. Marie J. Lankford and Mrs. Gloria J. Carter, who patiently typed the numerous drafts of the manuscript; and Miss Utha Conrad, who edited the manuscript in final form. And finally, a special word of appreciation is extended to the University Press, and especially Mr. William D. Grote, Manager of the Printing Department, for consultation and other invaluable aid in getting the report in final form. While this report is in a technical sense the result of the cooperative efforts of many, the author assumes the responsibility for the conclusions.

DEFINITIONS AND DESCRIPTIONS OF
OCCUPATIONAL CATEGORIES 54

APPENDIX TABLES 59

HIGHLIGHTS OF THE STUDY

Summary of Findings

1. White collar occupations increased 56,000 jobs or 21 percent from 1950 to 1960. In the white collar categories largest gains occurred in the professional and technical occupations and clerical jobs.

2. Blue collar occupations declined 102,800 or 15 percent. Among the blue collar occupations only service occupations, including private household, had a significant increase of 14,900 jobs. But farmers and farm workers lost nearly 115,000 jobs during the period 1950-60.

3. Analysis of job shifts by industries shows that during the ten-year period there was heavy shrinkage of employment in agriculture and mining and a large increase of employment in manufacturing, with a somewhat slower rate of gain in trade and services.

4. In the broad trade and services category, professional services (mainly teachers) had by far the largest growth (53 percent) followed by somewhat lesser rates of gain for finance, insurance and real estate, and public administration.

5. Compared to the United States, occupations in Kentucky had lower percentage increases or higher percentage declines. Basing the comparisons on industry of employment, manufacturing exceeded the percentage increase of the nation while agriculture and mining exceeded the percentage decline for the United States.

6. Comparing the United States in terms of the occupational structure, Kentucky had in 1960 relatively less white collar jobs than the nation despite a 10 percent closure of the gap.

7. In terms of industrial structure Kentucky rose relative to the nation in manufacturing but had in 1960 still only one job in five compared to over one in four for the United States. Kentucky improved its industrial structure by 10 percent in trade and services but lost ground slightly in agriculture.

8. The shifts of employment in Kentucky from 1950 to 1960 resulted in a net loss of 87,000 jobs for men and a gain of 69,000 jobs for women. Elimination of the negative effects of agriculture and mining from employment of men shows that the gain would have been 55,800 jobs in all other industries.

9. Women in 1960 had more than their share of white collar occupations and substantially less than their share of blue collar jobs

except services in which they held two-thirds of all the employment. Women controlled two-thirds of the jobs among clerical workers.

10. For the industrial classes of jobs, women had largest gains both in durables and nondurables manufacturing and in all types of services but particularly in professional services (teachers). Employment of women is of practically no significance in agriculture, mining and construction. They have a relatively high percentage of employment in nondurables manufacturing (37 percent) and in most of the trade and services industries, controlling over two-thirds of the jobs in personal and professional services.

11. Important changes expected in the U.S. economy from 1960 to 1975 which will influence Kentucky occupations are: (a) the shift to relatively more white collar workers--to almost one in two jobs with an increase of about 46 percent in total employment; (b) further rise in the ratio of female workers but at a slower rate than from 1950-60; and (c) further rise in the emphasis on service-producing industries at the expense of goods-producing industries. In the period the former will gain three jobs to each job gain for the latter.

12. Trends in the occupational and industrial structure of Kentucky, strongly influenced by changes in the U.S. economy, will reflect certain conditions which are peculiar to the state's economy. These are: (a) stabilization of employment in mining and near stabilization in agriculture; (b) enlarged tendency for Kentucky to catch up on the nation in the ratio of employment in manufacturing; and (c) stepped up rate of growth in population, employment and income in line with projection II potentials, which still falls short of U.S. growth rates.

13. Projections of the state's economy from 1965 to 1975 indicate that Kentucky may probably add 111,300 white collar jobs and 76,600 blue collar jobs representing percentage increases of 30 percent and 13 percent respectively.

14. Among white collar workers largest gains in jobs are expected in the professional and technical occupations and in the clerical worker classes; among blue collar occupations biggest increases will be in the service type jobs. Significant gains are expected also in the skilled and semiskilled occupations due to the larger relative growth expected from manufacturing.

15. Annual rates of increase yearly for some of the major occupational classes are as follows: professional and technical workers, 3,890 jobs; clerical and kindred workers, 3,660; service workers, 3,280; and skilled craftsmen, 2,860 jobs.

16. The job types likely to be in greatest demand, based on yearly growth rates during 1950-60, will be teachers, production line

assemblers, mechanics and repairmen, linemen and servicemen, professional nurses, cashiers, sewers and stitchers, auto service and parking lot attendants, truck and tractor drivers, welders and flame cutters, and many others.

17. Job openings from replacement demands to meet deaths and retirements of older workers are estimated to amount to about 9,300 yearly in the white collar occupations and 11,700 jobs yearly in the blue collar occupations.

Conclusions

1. A surprising number of job openings, 30,000 to 41,000 yearly, will be available, considering the effects of growth in the economy plus deaths and retirements of older workers. The problem is not opportunity for employment but the supply of properly trained workers to fill the vacancies that will occur, involving training levels all the way from high school education with vocational training to a Ph.D. from a college in some highly specialized field. Training an adequate number of workers with specialized skills and proper attitudes is only one aspect of the problem; keeping them up to date with rapid changes in science and technology is far more difficult, constituting the basic obstacle to progressively higher levels of employment in the state and national economies.

2. From the standpoint of the worker there is the problem of developing sufficient intellectual capacity and flexibility to permit the process of continuous education and training. The challenge to the dispensers of education and training is that the new demands for skilled training and the updating of skills and technical know-how on such an enlarged scale threaten to overwhelm the public educational system at every level of learning.

3. Approximately one-fourth of the U.S. population is constantly occupied in formal programs of education, another 5 to 10 percent in other programs, at an expenditure rate equal to about 5 percent of GNP--about half the rate of expenditure on national defense and one-third the rate of gross private domestic investment in plants and production equipment. Perhaps the public will be slow to accept the idea, but it should not, that education, reeducation, training and retraining may need to involve continuously one-half the U.S. population and require perhaps 15 percent of GNP, same as the ratio of investment in plants and production equipment.

4. Continuation of the high rate of technological progress in agriculture coupled with an expected practically complete commercialization of the production processes forecast the need for an increasing number of skilled and technical workers in agriculture. This prediction is reinforced by the beginning need for large scale replacement of older workers in agriculture from deaths and retirements.

5. An adequate supply of highly trained workers with capacity for future training is being increasingly recognized as a basic limitation of an area or even a state to secure and hold industry. Brainpower and skillpower limit the ability of companies to solve technological problems, meet competition and survive in the rapidly changing, complex world.

6. The increasing number yearly of vacancies in middle management and top executives from deaths and retirements of older workers will affect the future progress and survival of company enterprises of every size, having significance also for economic growth and job creation for the state and for the nation. The limited number of potential executives from age class 25 to 40 to fill these vacancies provides large potentials for institutions of higher learning to offer executive training programs sufficiently broad and extensive to train numerous company junior executives for these openings.

7. The modern day worker, living in a complex, rapidly changing world of work, can expect continuous employment with progressive growth in responsibility and earnings only as a result of continuous reeducation and/or retraining to keep up-to-date a skill or technical know-how or both.

8. A great new frontier in training is opening in service jobs. These require unique abilities to dispense an intangible service, which when successful obtains instantaneous, enthusiastic and complete acceptance by the customer. The potential number of workers to fill the expanding demands for such jobs is large, being formed by that fairly large group in society who is incapable of acquiring and keeping up-to-date an intellectual specialty or technical skill but who could acquire necessary service skills through proper instruction. Educational and training organizations are challenged to open the barriers to employment of those groups by providing adequate training in the composite of factors that constitute service skills.

INTRODUCTION

Rapid complex change is what makes the modern world volatile and difficult. Change is best typified by what is happening to two major phases in our national life: urbanization and technological change. Technological change affects the environment and its relationship to man, whereas urbanization is a force in our economic and political life which reflects the adjustment of mankind to job opportunities and living conditions, brought about mainly by technological change.

Advance in science and technology is accelerating so rapidly scientists have estimated that the scope of human knowledge will double in the next decade... During 1950-60 urban population in the United States increased over twenty-eight million; the increase during the next decade will be larger. In 1960 about two persons in three lived in urban centers, while by 1970 it is expected about three persons in four will be living in urban centers.

Both types of accelerating change impose a challenge to the individual to find and hold a job, to move where jobs are located and to adjust to the new conditions of life, primarily in urban centers. Current data indicate that the young man of age 20 in his first job will probably have from six to seven entirely new jobs during the course of a working life estimated at 43 years. The chances are that at least half of these jobs will be in entirely new urban centers and perhaps in a different state. The job change will represent not only a new type of work but will also require a different skill, certainly a skill that has been updated.

The worker can expect to survive and capitalize on an increasingly complex and rapidly changing job world in an urban environment only by a constant process of training to: (a) hold more effectively the current job and (b) prepare for an entirely new job that might be only slightly related to the current job. All of this means that

35

only the worker with the ability and the flexibility to keep up with technological change in a specialized field and to broaden to related fields through acquisition of new technical skills will have the best chance not only for continuous employment but also to reap fully the rewards from a rapidly changing world.

The significance of this conclusion is shown by the fact that in the decade 1950-60, 7 million new jobs were created in the United States, of which 90 percent were in the white collar category. Among the total of 7 million new jobs, 3 million were classified as professional and technical; 2.7 million, clerical and sales; 0.9 million, skilled; and 1.8 million, service and private household; but farmers and farm workers declined by 2.0 million jobs. Job opportunities tended to decline both in the semiskilled and the unskilled categories.[1] The salary and wage rewards for those with technical competence or a craft skill are indicative also of the market demands for these characteristics of workers. According to the studies of the U.S. Department of Labor based on data for 1959, the skilled craftsman 25 to 34 years of age with a high school education was making about $1,600 annually more than the unskilled laborer; the technician in the same age category and with the same educational characteristics was making $600 more yearly than the skilled craftsmen and about $2,200 more than the unskilled worker.[2] Studies indicate that the earnings gap between workers is tending to increase because of the increasingly complex technology.

Objectives of Study

The objectives of this study are (a) to determine the trends in the occupational pattern of Kentucky for 1950-60 and compare to the U.S. economy; (b) to analyze the factors contributing to the shifts in the occupational structure during the period 1950-60 and determine the significance of these changes for the potential demand for

---

[1] Manpower Report of the President, March 1964, p. 199.

[2] Ibid, p. 266.

trained workers during the period 1965-75; (c) to prepare projections of probable demand yearly for different types of skilled, clerical and technical workers based on the underlying technological developments, market demand for skills and technical competence which dominate both the national and the Kentucky economies; and (d) to interpret the significance of the prospective trends in demand for technical and skilled workers to training programs in the state of Kentucky and also to show how all of this relates to the economic development of the state.

Scope and Method

The scope of this study is limited to the main occupational categories set forth in the 1950-60 Census of Population. The analysis is in terms of statewide trends and does not try to break down the overall changes for the state to the different economic areas. Area measurements of demand for technical and skilled workers can be determined only after a detailed analysis of the current use and future requirements of skilled and technical workers by the individual companies in different areas of the state.

The method of analysis is based on trend-line studies of changes in the state's employment pattern from 1950 to 1960, ratio of these relationships, comparison of trends and occupational patterns between Kentucky and the United States, analysis of the relationships between ratio of employment in the different categories in Kentucky with those of the nation and reconciliation of changes in the occupational pattern of the state with prospects for growth in Kentucky's economy to 1975.

The assumptions governing the study are as follows. (1) Kentucky's current rate of growth in employment and output of goods and services will not only be sustained but accelerated as the 1970's are approached. (2) Both nationally and locally scientific advance and technological change will continue to accelerate. (3) The state's business, political and educational leaders will maintain a very high interest in

development of human resources for employment and will work more intensively for expanded employment opportunities in Kentucky.
(4) International relationships will not worsen into a worldwide armed conflict nor will other cataclysmic events occur, such as the earthquake in Alaska or heavy floods in Oregon and Northern California, to set back the growth of the state of Kentucky.

The major limitation on this study is that the occupational categories given in the census are broadly defined and are not very helpful in terms of jobs. However, specific jobs from the major occupational categories can be roughly deduced. Precise estimates for such jobs as auto mechanics, electronic technicians, practical nurses, etc., will require detailed surveys of the current use and future requirements by companies in Kentucky for specific jobs.

EMPLOYMENT TRENDS IN THE KENTUCKY LABOR FORCE, 1950-60

Occupational Change[3]

The underlying factors dominating recent employment changes in the state of Kentucky have been (a) slow growth in population from 1950 to 1960, approximately 93,000; (b) continued concentration of population in a few areas in Kentucky--mainly around Cincinnati, Louisville, Lexington, Evansville, Paducah, and Ashland; (c) the declining employment in agriculture and mining, directly and indirectly related to changing technology; and (d) the rise of unemployment from 36,000 in 1950 to approximately 60,000 in 1960.

Table 1 presents a comparison of trends in employment from 1950 to 1960 of nine occupational categories with a further subdivision according to whether they occurred in the white collar or the blue collar categories.[4] Certain defects exist in the data which affect not only the strength of the trends but also interpretations of them. The most glaring defect, of course, is the relatively large size of the "not classified category," which increased from 14.9 thousand in 1950 to 42.9 thousand in 1960. This type of employment information developed probably because many respondents failed to give sufficient information to the census enumerators to permit classification to the nine categories given. It is strongly suspected however that most of these "not classified" occupations occurred in connection with the unskilled, semiskilled and probably managerial classes. The fact that the omissions seem to be most heavily concentrated in the blue

---

[3]Note: The analysis relative to occupations and industrial types of jobs is based on civilian employment. The armed forces, 38,295 in 1960, are of necessity excluded from the analysis.

[4]Blue collar types of jobs have been broadly defined for the purposes of this study to include craftsmen, semiskilled assembly line workers, unskilled workers, all types of service workers, and farmers and farm workers.

TABLE 1

MAJOR OCCUPATIONAL TRENDS IN KENTUCKY FROM 1950 TO 1960

Occupational Category	1950 (In thousands)	1960 (In thousands)	Change 1950-60 Total (In thousands)	Change 1950-60 Percentage change
WHITE COLLAR				
Professional, technical and kindred	59.8	83.3	23.5	39.3
Managers, officials, and proprietors	67.1	68.7	1.6	2.4
Clerical and kindred workers	81.2	102.1	20.9	25.7
Sales workers	55.2	65.1	9.9	17.9
Subtotal	263.3	319.2	55.9	21.2
BLUE COLLAR				
Skilled craftsmen, foremen and kindred workers	110.3	116.8	6.5	5.9
Semiskilled operatives and kindred workers	189.9	185.5	-4.4	-2.3
Service workers including private household	81.4	96.3	14.9	18.3
Farmers, farm managers and farm workers	243.8	129.2	-114.6	-47.0
Unskilled laborers except farm and mine	51.1	45.9	-5.2	-10.2
Subtotal	676.5	573.7	-102.8	-15.2
Not classified	14.9	42.9	28.0	187.9
TOTAL	954.5	935.9	-18.6	--

SOURCE: U.S. Bureau of the Census. U.S. Census of Population: 1960. Vol. I, Characteristics of the Population. Part 19, Kentucky. U.S. Government Printing Office, Washington, D.C., 1963, p. 160.

collar classification should be taken into account in analyzing the trends of this class compared to white collar workers.

Another defect of the data is that the total reported for 1960 appears too low in view of a 93,000 population increase. Seasonal factors in employment, especially important in agriculture and some manufacturing, are responsible.[5]

The data in Table 1 show very clearly that the largest employment gains have occurred in four of the nine occupational categories given. In order of importance the gains are:

Professional, technical and kindred workers...39.3 percent
Clerical and kindred workers.....25.7 percent
Service workers including private household...18.3 percent
Sales workers.....17.9 percent

The largest decline was in the farmer and farm worker category which lost 114,600 jobs in the ten-year period, or a decline of 47 percent. Although the semiskilled operatives and unskilled laborers also had declines, they are not significant as compared to the farm worker category. The heavy weight of the decline in farm jobs was so great that it caused the entire blue collar category to show a loss of 102,800 jobs during the period, or at the rate of 10,300 jobs yearly. A more complete allocation of the unclassified category at the bottom of the table would undoubtedly improve the situation of the semiskilled and unskilled workers.

The significance of the data given in Table 1 is that it reflects a movement of the state's economy towards white collar jobs which require a moderate to a large amount of education supplemented by a vocational skill. The data also reflect the fact that the state's economy is becoming better balanced while higher earnings of white collar jobs will raise per capita income of the state over a period.

---

[5]Corrections for this underenumeration have been reported in Essays in Southern Economic Development. (Chapel Hill, N.C.: University of North Carolina Press, 1964), pp. 195-238. It has not been possible to reflect the larger totals in the nine major occupations, however.

Industrial Trends in Employment

Breakdown of employment by industry is helpful in determining the types of production activities which are increasing and also declining. This information is useful relative to policy on economic development, both by business leaders and by state agencies.

Table 2 provides a detailed comparison of changes in employment in the state of Kentucky from 1950 to 1960 according to major industrial categories. Analysis of the information in the table indicates that very heavy job losses occurred in the agricultural and mining industries from 1950 to 1960. In fact, loss of employment in these two industrial categories was close to 50 percent in the period. Offsets against these losses occurred at the greatest rate in manufacturing with about equal emphasis on durable goods manufacturing and nondurable goods manufacturing. Relatively large gains of 14 percent occurred in the nonagricultural-nonmanufacturing segment which includes retail and wholesale trade; real estate, finance and insurance; transportation, communication and other utilities; government and public administration, and several other minor categories. The total gain of employment of 56,800 was about 20 percent larger than the 47,300 job gain in manufacturing. Construction expanded employment only 10 percent. The shift from agriculture and mining to manufacturing and nonmanufacturing activities, resulting in relatively less emphasis on the former as an employment outlet and relatively more on the latter, has provided a better balanced industrial structure for the state.

In the future, employment gains by industry are expected to continue in manufacturing. Employment increases in nonagricultural-nonmanufacturing industries will probably accelerate in the period ahead because of rising demand for services in the national economy. Not so large a decline in agriculture is expected because the impact of technological revolution is declining in severity. Some further decline of employment in agriculture is expected but at a far less rapid rate than occurred between 1950-60. In the case of mining which

TABLE 2

TRENDS IN EMPLOYMENT BY INDUSTRIES IN KENTUCKY, 1950 TO 1960

[a]The total is greater than the parts because of a "not classified" category.

SOURCE: 1960 Census of Population, ibid, pp. 19-164.

has been greatly influenced both within and outside the mining industry by technological change providing substitutes for coal, it is probable that employment is close to a point of stabilization. In fact we may perhaps have some small increase over a period in employment in mining in Kentucky because of the enlarged population growth of the United States and continued growth in gross national output. Construction may be expected to expand more rapidly than during the past decade because the growth prospects of the state's economy in population, income and trade, and manufacturing are distinctly improved. These expected growth rates will require greater capacity for industry and also more residential homes and related facilities.

Changes in Kentucky and the United States Compared

Analysis of the relationship between changes in Kentucky and the United States considers both occupational trends and industrial trends.

Comparisons of occupational change are given in the tabulation below:

SOURCE: 1950: U.S. Bureau of the Census. U.S. Census of Population: 1950. Vol. II, Characteristics of the Population. Part 1, United States Summary. U.S. Government Printing Office, Washington, D.C., 1953, pp. 1-128.

1960: U.S. Bureau of the Census. U.S. Census of Population: 1960. Vol. I, Characteristics of the Population. Part 1, United States Summary, U.S. Government Printing Office, Washington, D.C., 1964, pp. 1-272 to 276.

The data show that employment gains of the rapid growth occupations were greater in the United States than in Kentucky. On the other hand the declining occupations in the United States, which were the same roughly as in Kentucky, declined substantially less. Similarly, Kentucky had largest gains in the occupations in which the U.S. had largest gains. These occupations are professional, technical and kindred; clerical and kindred; sales and service workers. Kentucky had almost one-fifth greater percentage decline in farm jobs than the United States. The larger decline of farm occupations in Kentucky occurred because the state had during 1950-60 over twice as much agriculture relatively as the United States.

Summary of the comparison between the United States and Kentucky according to industrial category is given in the following tablulation:

Industrial Category	Percentage Change from 1950 to 1960	
	United States	Kentucky
Agriculture, forestry or fisheries	-39	-46
Mining	-30	-46
Construction	11	10
Manufacturing

Not classified	210	101
TOTAL	15	a

[a]Not applicable

SOURCE: See preceding tabulation, ibid, 1950, pp. 1-132 and 1960, pp. 1-280.

The data show that the trends by industries were relatively stronger in Kentucky than the United States except in the case of construction and nonagricultural-nonmanufacturing industries. The loss of jobs in agriculture and in mining was 46 percent in Kentucky compared to 39 percent and 30 percent respectively for the United States. It is interesting to note that the loss of employment from mining was 50 percent greater relatively in Kentucky. The reason for the greater loss in Kentucky is due to the greater concentration of coal mining in the state. Coal mining has had a comparatively higher rate of technological change both in production techniques and market substitutes than other types of mining. Employment gains in manufacturing were relatively larger in Kentucky because the base from which the percentage is computed is substantially smaller than the United States.

The state still has relatively less manufacturing than does the nation as a whole. In the case of trade, services, transportation, communication and similar industries a smaller gain in Kentucky is explained by the fact that the state's economic structure is in an

earlier stage of development than that of the nation. Kentucky does not have as high a percentage of urban population. On the other hand it is a relatively more important agricultural state than the United States as a whole.

SHIFTS IN THE DISTRIBUTION OF OCCUPATIONS, 1950-60

Change in Occupational Structure of Employment

Data on the percentage distribution of occupations in Kentucky compared to the United States are provided in Table 3. Analysis of these ratios indicates that during the period 1950 to 1960 Kentucky acquired relatively more white collar workers and relatively less blue collar workers. At the beginning of the period approximately one worker in four in the state was white collar whereas by 1960 somewhat more than one worker in three was white collar. In comparison over four workers in ten were white collar in the United States. All four of the white collar classes in Kentucky gained during the period but larger relative gains in the occupational structure were made by the professional and technical classes and clerical workers. Among the blue collar workers the most characteristic factor is the relative decline which occurred during the ten-year period. In these occupations, the decrease was led by farmers and farm workers which declined by almost half in relative importance during the period. The biggest gain relatively was by service workers; skilled craftsmen had a comparatively smaller increase. The semiskilled category held its own, while the unskilled classification lost position.

Compared to the distribution of occupations for the United States as a whole, Kentucky had the sharpest relative gain in white collar jobs with all four classes compositely increasing about one-tenth. The most significant change in the blue collar occupations compared to the United States was a relatively smaller decline in semiskilled, farm workers and unskilled workers than in the United States because these occupations decreased more in the U.S. than in Kentucky. But Kentucky did make substantial gains on the U.S. in two blue collar occupations--skilled craftsmen and service workers.

Overall, Kentucky lost a little ground compared to the United States in blue collar occupations and, contrariwise, registered some

1960: U.S. Bureau of the Census. U.S. Census of Population: 1960. Vol. I, Characteristics of the Population. Part 1, United States Summary. U.S. Government Printing Office, Washington, D.C., 1964, pp. 1-277.

relative gain in the proportion of white collar workers. Consequently the state's occupational pattern became more like the occupational structure for the United States and therefore better balanced not only between white collar and blue collar occupations but also within each major category. This is particularly true of farm occupations which declined from roughly one job in four in the state in 1950 to approximately one job in eight by 1960. The figures on farm employment published by the U.S. Department of Agriculture indicate that this trend is continuing. Currently, the state is probably down to about one job in ten in agriculture, which reflects continued progress from technological change.

Change in the Industrial Structure of Employment

The industrial structure of employment refers to the distribution of jobs to categories or groups such as manufacturing, agriculture, wholesale and retail trade, and services. Table 4 presents data on the percentage distribution of employment in the major industrial job outlets in Kentucky compared to the United States, both in 1950 and 1960. The analysis in terms of industrial structure not only confirms but further fortifies the conclusions relative to occupations given above. During the period 1950-60 the agricultural industry as a source of employment declined 45 percent, and mining which is relatively over four times more important than in the United States was almost one-third less. Among all the main industrial categories given in the table the biggest relative gain occurred in manufacturing which rose in relative importance about 34 percent. This is shown by the fact that in 1950 approximately one job in six was in manufacturing whereas in 1960 over one job in five was in manufacturing which compares to somewhat more than one job in four in the United States. Durables and nondurables manufacturing industries were almost equally important in the employment structure of the state, and both show the same relative gains from 1950 to 1960.

Trade and services as a broad category had a relative gain of about 16 percent, less than one-half that for manufacturing. Of the seven categories given for trade and services, the largest relative gain in employment structure was shown by professional services, followed in order by finance, insurance, and real estate (43 percent), public administration (26 percent), and wholesale and retail trade (12 percent).

The decline of the agricultural and mining industries, both heavily affected by technology and reflecting problems of adjustment and low per capita income, not only was to the advantage of the state during the decade 1950-60 but will continue to its benefit. Replacement of these job losses occurred from relatively large job gains in manufacturing, followed by somewhat more modest gains in trade and services which improved the state's industrial balance.

SOURCE: Table 3, ibid, 1950, pp. 1-135 and 1960, pp. 1-181.

The fact that during the decade 1950-60 Kentucky's industrial balance became more like that of the nation's is the basis for further improvements in the future. It is expected that in the next decade further relative losses of jobs from agriculture will occur but at a greatly reduced rate. The ratio of employment in manufacturing in Kentucky may be expected to rise to 25 and possibly 27 percent which is the nation's ratio. At the same time further gains in relative employment in trade and services may be expected to follow the rise in demand for services. Specifically, further large gains can be predicted for professional services, public administration, finance, insurance, and real estate, and wholesale and retail trade, while business and repair services may be expected to reverse from a 1950-60 declining ratio to a rising ratio. This latter prediction is supported by growing demands for complex maintenance and repair services on mounting quantities of sophisticated durable goods in the hands of the consuming public.

HOW SHIFTS IN EMPLOYMENT HAVE AFFECTED MEN AND WOMEN

It is common knowledge of course that women are increasingly finding a place in the modern economy. A number of conditions have favored the emancipation of women to the world of work. The biggest factor has been the rapid increase in urbanization and the accessibility to clerical and service types of jobs which this affords. At the same time urban living has increased the pressure on living costs which provides strong incentives for women to seek employment in service occupations and clerical and sales types of jobs. Secondly, the trend towards higher and more sophisticated education among all classes of our population and especially women has made them more valuable workers and at the same time more capable of adapting to modern demands in the labor market. In the third place rapid changes in technology which have provided an accelerating number of jobs for engineers and scientists have opened support positions for women in the technician and clerical categories which often are filled by men but primarily by women where they have had proper educational and vocational training.

Occupational Comparisons

Data for Kentucky for the census period 1950-60, as shown in Table 5, indicate that women workers in Kentucky fared quite well in the limited economic expansion which the state experienced. In the total of all the occupations women gained 69,100 jobs compared to a loss of 87,300 jobs for men. This loss on the part of men is startling in view of the fact that they are more than two and one-half times more numerous in the labor force than are women.

The heaviest losses of jobs were suffered by men in the blue collar category among farmers and farm workers which accounted for about a 112,700 job decline during the ten-year period. In three out of the other four categories men also gave ground in jobs and had

TABLE 5

[a]Excludes farm salaried workers.
[b]Includes private household workers.
[c]Except farm and mine.

SOURCE: U.S. Bureau of Census. U.S. Census of Population: 1960. Vol. I, Characteristics of the Population. Part 19, Kentucky. U.S. Government Printing Office, Washington, D.C., 1963, pp. 386-91.

especially heavy losses among semiskilled workers where 5,000 jobs were lost. In contrast, women gained more than 21,000 blue collar jobs, primarily in the service occupations which accounted for 16,000 of these jobs. In the semiskilled category, mainly for production and assembly line work in factories, an additional 7,700 jobs were added.

In the white collar grouping of occupations both men and women gained significant numbers of jobs during 1950-60 but the rate of job growth for women was almost twice as large as for men. Of the 20,300 white collar job expansion for men, over 12,000 jobs occurred in professional, technical and kindred types of occupations, with smaller gains in the three remaining classes. In the case of women workers largest job gains developed in clerical and kindred occupations with a total expansion of 18,800 jobs. Another 11,400 job pickup by women occurred in the professional, technical and kindred group, almost as large as the gain for men.

Table 6 shows a comparison between total jobs in the nine occupational categories with the corresponding number held by women workers in Kentucky. Comparing these figures it should be borne in mind that women occupy only 28.2 percent of the labor force in Kentucky. Therefore in any occupational category where women exceeded 28.2 percent they were doing relatively better than men in 1960. Accordingly it may be noted women exceeded the standard rather substantially in all of the white collar classes, except managerial, officials, and proprietors. For the clerical and kindred types of workers, the ratio was nearly two-thirds. Overall the white collar composite was 43.5 percent.

For the broad category of blue collar workers, as expected, women do not stand as high in the ratio as do men. In fact, only 20.8 percent of the blue collar workers were women compared to their proportion in the labor force of 28.2 percent. However, in the service occupations women occupied 67.8 percent indicating the great dominance in this one category of blue collar occupations. They were also relatively high in the semiskilled occupations although substantially below 28.2 percent.

Comparison by Industrial Types of Employment

Analysis of jobs by broad industrial categories, Table 7, shows very clearly the points in the state's economy where the important

SOURCE: U.S. Bureau of the Census. U.S. Census of Population: 1950. Vol. II, Characteristics of the Population. Part 17, Kentucky, p. 39. _____. U.S. Census of Population: 1960. Vol. I, Characteristics of the Population. Part 19, Kentucky, p. 164.

_____. _____. _____. Part 1. U.S. Summary, pp. 280-283.

shifts between men and women workers occurred. As suspected, the big decline of jobs by men occurred in agriculture and in mining which accounted for over 143,000 job losses during 1950-60. There were some minor losses of jobs by men also in trade and services. But the employment gains for men were more favorable in two broad industries. Manufacturing provided 34,400 additional jobs for men; and trade and services, another 8,500 jobs. Men also gained 4,700 jobs in construction.

The comparison of job losses and gains for women indicates only minor losses in agriculture and mining where women do not loom large in the first place as employees. While men dominated the gain in manufacturing, women dominated the job gain in trade and services. Men gained three jobs in manufacturing for each job gained by women; in services, women gained six jobs approximately for each job gained by men during 1950-60. Women had job expansions in all seven service types of jobs itemized in Table 7 but the most important job area was professional services where the job expansion was 25,000.

Omission of agriculture and mining gives a picture of how male employment performed in the rest of the Kentucky economy. The results show that instead of a loss (so great was the influence of agriculture and mining) a net gain of 55,800 jobs occurred in the balance of Kentucky's industries. Even with this assumption the job comparison was to the disadvantage of men since they occupy 2.5 jobs to 1 for women in the employed labor force. Based on these adjusted figures there was 0.8 job gain for men to each job increase by women. Overall with agriculture and mining included men lost 1.26 jobs for each job gained by women during the period 1950-60.

Measures of the relative importance of women in the different industries in Kentucky are shown in Table 8. The standard of comparison is 28.2 percent for women. On this basis it is noted that women were of little or no real importance in agriculture, mining, and construction in 1960. They were relatively low in durables manufacturing, business and repair services, and transportation, communication and other utilities. Women were substantially above the standard of

28.2 percent in nondurables manufacturing, wholesale and retail trade, and finance, insurance, and real estate. They occupied almost two-thirds of the jobs in personal and related services and also in professional services.

SOURCE: Table 7.

AGE DISTRIBUTION OF LABOR FORCE RELATED TO THE FUTURE

It is common knowledge of course that there has been a great boom in the birth rate since about 1946. This reversal of the low birth rate from 1930 to about 1945 is responsible for the relative scarcity of persons in the broad age class 20 to about 40.[6] There are comparatively more persons over 40 years old; the age classes under 20 are the largest of all. This distortion in the age classes of the population is reflected in the employed labor force both in Kentucky and the United States as shown by Table 9. The data show that both in Kentucky and the United States there is a comparatively large number of the working force in age classes 14 to 34. While the 35 to 49 age class is somewhat more numerous than the 50 and over age class, it is substantially less compared to the normal distribution to be expected for this age class. Comparing Kentucky to the United States it is noted that the state is slightly higher in the younger age group than the nation and slightly higher in the older age group, reflecting the fact that Kentucky has had a heavy out-migration for a number of years which tends to drain off the people from age 18 to 35.

A measure of the age distortion of the employed labor force in the United States can be deduced by some rough comparisons of the distributions of 1950 and 1960. In 1950 the relative number of workers in age class 14 to 34 was 12 percent higher than in 1960, 7 percent lower in age class 35 to 49, and 10 percent lower in age class 50 and older. In the period 1960-75 it is expected that the age class 14 to 34 will move back towards the relative number shown in 1950 with 5 percent more workers comparatively in this age class than in 1950. In fact by 1975 almost 46 percent of the working force will be in age class 14 to 34.

---

[6]This age class is most significantly affected in the age range between 20 and 35.

TABLE 9

COMPARISON OF THE AGE DISTRIBUTION OF THE EMPLOYED CIVILIAN LABOR FORCE OF KENTUCKY AND UNITED STATES, 1960

Age Class	Kentucky		United States	
	Number Employed (In thousands)	Percent of total	Number Employed (In millions)	Percent of Total
14-34	348.6	37.2	23.6	36.7
35-49	322.9	34.5	22.8	35.4
50 and over	264.5	28.3	18.0	27.9
TOTAL	936.0	100.0	64.4	100.0

SOURCE: U.S. Bureau of the Census. U.S. Census of Population: 1960. Vol. I, Characteristics of the Population, pp. 1-499 and pp. 19-361.

National projections of the number of the working force from 1960 to 1975 indicate a 49 percent increase in the age class 14 to 34; a very small increase for age class 35 to 49; and a 20 percent increase for age class 50 and over. The conclusion therefore both for Kentucky and the United States is that a problem is developing in industry, government, and public administration relative to the supply of potential executives below age 40 to fill the large number of positions expected to develop in middle management and top executive positions in companies during the next decade.

Table 10 contains a comparison of the distribution of white collar and blue collar workers by age classes according to sex in 1960. In the white collar class female workers were relatively more important in the younger age group, 14 to 34 years old, and tended to decline with each older age class. In the blue collar category female workers tended to become slightly more important with age. Men were somewhat higher in age class 35 to 49. In the period ahead, 1965 to 1975, it is apparent that more numerous job opportunities will

be available in the white collar classes which is consistent with the growing number of workers in age class 14 to 34.

The greater demands for white collar workers who have a better educational level, coupled with the large numbers of young people entering the labor force, forecast a rising emphasis on more years of schooling followed either by vocational or technical training. Older workers may be expected to continue to fall heir to the comparatively smaller number of blue collar jobs left to them by default because of poorer levels of education and training and the tendency of companies to discriminate against older workers. Lacking good basic education and flexibility in adapting to change, older workers may not expect to turn out in force for retraining programs nor participate very readily in adult education. Therefore the declining opportunities for older workers may not be overcome to any great extent by their training for employment in white collar occupations where the job openings will be much larger.

PROJECTIONS OF MAJOR OCCUPATIONS TO 1975

Important Changes in United States Economy

The shift from white collar to blue collar jobs is expected to accelerate during the period from 1960 to 1975. In 1960 about four jobs in ten were white collar. This ratio is expected to almost equal one job in two by 1975. The total increase in white collar jobs during this period will be 46 percent while blue collar jobs will expand approximately one-fifth during the period. In actual jobs, about 1.7 white collar jobs will be created for each blue collar job. See Appendix Table A.

The second important development anticipated in the national labor force is that the ratio of women workers will continue to rise but at a somewhat slower rate than occurred during 1950-60 when the overall increase in the ratio was 3.4 points. While the ratio of women in the labor force was slightly over 32 percent in 1960, the ratio is expected to rise to 34.5 percent by 1975. Overall growth in labor force of the two sexes is expected to be 27.4 percent or an estimated increase of 20 million workers in the fifteen-year period. The percentage growth of the women labor force of around 37 percent will be approximately 1.5 times larger than for men. However the job gain ratio of the two sexes will be reversed. In the period 1950-60 women gained 2.0 jobs to each job for men; in the period 1960 to 1975 the job gain ratio will favor men, when they are expected to gain 1.3 jobs to each job for women. This reversal over 1950-60 is due to the fact that participation of women in the labor force is expected to rise only slightly toward the end of the period. See Appendix Table B.

A further important tendency in the national economy which must be taken into account in projecting Kentucky's employment pattern in the next decade is the growing trend toward service-producing industries at the expense of goods-producing industries. In 1960

approximately 38 percent of total employment was in goods industries and 62 percent in service industries which represents a shift away from goods industries from 1950. This tendency will continue, and by 1975 the ratio of employment in service industries is projected at 66 percent. The percentage gain of employment in goods industries during the fifteen-year period 1960-75 is forecast at 25 percent in contrast with a 44 percent gain in service industries, or a growth of 1.8 times that of the service industries.

In terms of number of jobs created, the forecast is that three jobs will be created in the service industries to each job in the goods industries. Part of the difference in the ratio is due to the more rapid yearly percentage rate of growth in the service industries but is also due partly to the fact that service industries already account for more than six-tenths of total employment in the United States. Consequently, some of the more rapid growth of jobs in the service industries will be associated with the larger employment base. See Appendix Table C.

Projected Percentage Growth in Major Occupations for United States and Kentucky Compared

Projected growth percentages in occupations for the United States have been taken directly from page 244 of the March 1964 Manpower Report of the President. Comparable percentage changes for Kentucky have been developed by analytical relationships growing out of this section and details in preceding sections.

It is observed from Chart 1 that in every category of major occupations which reported an increase for the United States a comparatively less percentage increase is shown for Kentucky. On the other hand farm workers show a relatively sharper drop in Kentucky. While white collar workers are expected to have eight-tenths as large relative gain as the United States, blue collar workers in Kentucky will fare relatively less well, or roughly half the percentage increase of the United States. The unfavorable showing of blue collar workers in Kentucky is largely due to the comparatively large decline expected

CHART 1

Comparison of Expected Percentage Changes in Occupational Groups for United States and Kentucky 1965 to 1975

for farm workers and to some extent to the small increase anticipated for unskilled workers.

The basic factors which must be considered in analyzing the prospects for occupations in Kentucky relate to the comparatively slow growth of the state's economy. In the decade 1950 to 1960, Kentucky added only 93,000 population, and even after taking into account the adjustments for seasonal factors in agriculture and manufacturing, the total job gain viewed optimistically was probably only 35,000.[7] Population growth during 1950-60 was only 0.3 percent per year and has averaged 0.9 percent yearly since 1960, compared to an annual rate of growth for U.S. population of approximately 1.7 percent. Even if an optimistic growth is assumed for Kentucky during the period 1965-75 and a modest inflow of migration of people is assumed, the yearly population growth of the state can barely reach 1.6 percent during 1970-75. Consequently, taking all these factors into consideration, the absolute percentage change in the occupations that might be anticipated for Kentucky during the period 1965-75 must of necessity fall below rates of change anticipated for corresponding occupations at the national level.

Kentucky Projections

The projections of major occupations in Kentucky for 1965-75 are based on the highest potential population projection (II) to 1975 and corresponding gains in employment, income and retail sales which have been given in an earlier publication.[8] The percentage changes given in Chart 1 are assumed.

[7] John L. Fulmer. "Trends in Population and Employment in the South from 1930 to 1960 and their Economic Significance." Essays in Southern Economic Development (Chapel Hill: University of North Carolina Press, 1964), pp. 195-238.

[8] John L. Fulmer. "Economic Development Potentials in Kentucky, 1963-1975." Research Briefs. Bureau of Business Research, January 1965, pp. 11-12.

Table 11 provides a comparison of employment in Kentucky by occupations for 1960, 1965 and 1975. The expected changes are given in absolute numbers and percentages. It should be noted that the projections are based on the projection II increases in the state's population, employment and income[9] which will require some strong pushing by all of Kentucky's leaders to achieve these goals.

The projections indicate an increase of 111,300 white collar jobs from 1965 to 1975, an increase of 30 percent. The corresponding change expected in blue collar jobs is 76,600, a gain of 13 percent. In the white collar groups of occupations largest increases in jobs are projected for professional and technical and for the clerical occupations, with growth of 38,900 and 36,600 jobs respectively in the ten-year period. Among blue collar jobs the biggest increases are forecast for service workers, semiskilled factory workers and skilled craftsmen, which together show over 90,000 expected increase. Only farm workers are expected to lose jobs, 18,300 or 15 percent but only a fraction of the large declines which occurred from 1950 to 1960. The impact of rapid technological change in agriculture is being offset by growth in the national market. One should be cautioned against application of these figures unreservedly to present conditions since Kentucky does not yet have the rate of growth assumed by these projections. The projections are, however, within the limits of the resources and leadership of the state and are reasonably achievable.

YEARLY CHANGES IN MAJOR OCCUPATIONS AND SELECTED JOBS

1950-60 and 1960-75 Growth Rates Compared

The most significant factor about the 1950-60 growth rate was the mixed character of the state's economy, reflecting strong tendencies both to grow and to decline. By industries, agriculture and mining fell off in employment, manufacturing expanded rapidly and most trade and service industries except transportation and communications increased moderately. In the occupations, the blue collar group fell off sharply while the white collar group increased strongly. The shift in importance between these two broad categories of occupations was due to the new emphasis on service-producing industries.

In comparing employment growth rates of industries for the two periods, it must be borne in mind that the sharp employment adjustments from technology in agriculture and mining may be close to stabilization. Agriculture is expected to show some shrinkage in jobs during 1965-75. Growth of jobs in the surging areas of the state's economy probably will not to any significant extent be offset as during 1950-60 by losses from agriculture and mining. Therefore gains in the other major segments of the state's economy will be reflected almost completely and directly into a broad based expansion, not being obscured by shrinkages elsewhere in the economy as occurred from 1950-60.

Specific comparisons of job growth by occupations are given in Table 12. It is noted that the yearly rates of growth which are compared for the nine broad occupations indicate that during 1965-75 the expansion in jobs will be about double the rate for 1950-60 for most of the occupations. Very sharp increases in the skilled and semiskilled workers may be associated with further large expansion of manufacturing in the state, which currently has a ratio of manufacturing employment substantially less than the nation (21 percent compared to 27 percent).

TABLE 12

COMPARISON OF YEARLY GROWTH OF JOBS BY OCCUPATIONS IN KENTUCKY DURING 1950-1960 WITH PROJECTED GROWTH TO 1965-1975

Occupational Category	Net Growth Yearly in Number of Jobs 1950-60 Actual	1965-75 Projected	Ratio of 1965-75 to 1950-60
WHITE COLLAR			
Professional, technical and kindred	2,350	3,890	1.66
Managers, officials, and proprietors[a]	160	1,890	--
Clerical and kindred workers	2,090	3,660	1.75
Sales workers	990	1,690	1.71
Subtotal	5,590	11,130	1.99

Semiskilled operatives and kindred workers	-440	3,000	--
Service workers[b]	1,490	3,280	2.20
Farmers and farm workers	-11,460	-1,830	--
Unskilled workers	-520	350	--
Subtotal	-10,280	7,660	--
Not classified	2,800	1,230	--
TOTAL	--	20,000	--

[a]Excludes farm salaried workers.
[b]Includes private household workers.

SOURCE: Tables 1 and 11.

The overall total employment change for 1950-60 due to heavy blue collar losses was a slight negative, ignoring seasonal adjustment. Whereas, the total job gains for 1965-75 could average 20,000 jobs yearly of which 56 percent will be from growth in white collar jobs, ignoring the "not classified" category. The expectation therefore is for the creation of 1.5 white collar jobs for each new blue collar job.

Chart 2 depicts the expected growth in new jobs by occupations for Kentucky from 1965-75 and indicates how these yearly gains compare to those which were achieved in the period 1950 to 1960. The main conclusion is that for most categories yearly job gains in 1965-75 will be about double the yearly job gains during 1950-60. The slight 1950-60 yearly loss in semiskilled operatives is offset by good yearly gains during 1965-75 because of continued rapid expansion in manufacturing, with perhaps more emphasis on nondurables manufacturing than durables which are more subject to automation. Farmers and farm workers continue the decline but at less than one-fifth of the rate during 1950-60.

Worker Replacement Requirements for Different Occupational Categories 1965 to 1975

To this point new job openings have been the major point of emphasis. The number of net new job openings is tied directly to growth in the state's economy, which is close to 12,000 jobs currently, and is expected to rise to 20,000 yearly or more by 1970-75. Another source of job openings which should be considered by those training workers for the labor market in Kentucky is the replacement requirements of workers from death, retirement and quits.

In view of the distortion of the age distribution of workers in Kentucky towards the older classes of workers, mainly age 50 and over, the demand for trained workers simply for replacement is already a major consideration and will be a factor of increasing importance in the decade ahead. Deaths and quits occur at every age but increasingly so as the age of the working population advances. However, if the analysis is confined only to the age class 50 and over and is based only on the maximum total[10] effects known for retirements, 6.7 percent of the working population in age class 50 and over would be expected to cease employment each year. Based on the 1960 total employment in Kentucky in age class 50 and over, an estimated 17,700

[10] All retire at age 65.

CHART 2

Projected Additional Jobs by Occupational Categories from Growth in the Kentucky Economy from 1965 to 1975

job openings would occur annually. Adjustments to these figures should take into account the rather substantial death rate among men and the factor of quits to a minor extent for men but to a major extent for women. A counteracting factor is the tendency for many to work beyond age 65, especially where a formal retirement program is nonexistent. Balancing out the plus and minus factors creating job openings aside from growth in the economy and lowering the age limit to 45, it is estimated, based on normal labor attrition tables[11] that approximately 21,000 job openings yearly will be needed for worker replacements. This coupled with the 20,000 jobs[12] that may possibly be achieved from growth of the economy indicates that a substantial potential exists for the employment of young people entering the labor force, provided they are trained and have attitudes to make good workers. The fact that the number is unexpectedly sizable indicates the training problem facing the state of Kentucky.

A complete summary of the estimated job replacement requirements by occupational categories for age class 45 and over is given in Table 13. More than 1,000 job openings and in most cases approximately 2,000 job openings will be available in each occupational category except for unskilled workers during the period 1965 to 1975, based only on the number of workers in age class 45 and over in 1960. Since the relative number of older persons in the labor force will tend to increase all through the period 1965-75, these estimates are conservative.

The largest number of job openings is seen to be in the clerical and kindred workers class. The second largest number, and surprisingly, is the farm workers class with 3,278. Here of course the period of retirement of farmers is somewhat indefinite but the age factor of farmers and farm workers must be recognized as an increasing factor in the farm labor supply. Note should be made especially of

---

[11] Provided by U.S. Department of Labor.

[12] In the period 1960-63 the yearly expansion in jobs was 11,800 without an all out effort to push the state's economic growth.

TABLE 13

ESTIMATED JOB REPLACEMENT REQUIREMENTS YEARLY FOR KENTUCKY LABOR FORCE BY OCCUPATIONS

Occupational Category	Number of Job Openings Yearly from Replacement Demands[c]

SOURCE: Computed by Bureau of Business Research, based on labor attrition factors from the U.S. Department of Labor.

the skilled worker and the semiskilled worker categories which from the replacement factor alone will have available around 5,000 jobs yearly. This coupled with the growth factor expected in manufacturing and related areas where skilled and semiskilled workers will be employed show a prospect for an additional 5,900 workers, giving a total from both considerations of 11,000 workers during the period 1965-75 for these two types of occupations in the blue collar category group.

Indications of Specific Jobs Yearly

The type of analysis heretofore does not identify to any extent the specific jobs which will be available, such as mechanics, electricians, electronic technicians, medical technicians, etc. Based on data from the census it is impossible to spot these specific jobs precisely. This can be done only by detailed investigations of the companies employing them. This would require another type of study which is now in the planning stage.

Some indication of the possible strength of the demand for specific jobs can be gained from the data in Table 14 based on the rate of net job creation for the period 1950-60. The data show the actual net new job openings from growth in the state's economy during 1950 to 1960. For a number of these specific types of jobs, several hundred openings occurred yearly. Most notably these were and are listed in order of importance:[13] teachers, elementary and secondary schools, 854; salesmen and sales clerks (n.e.c.), 830; clerical and kindred workers (n.e.c.), 650; mechanics and repairmen, 633; linemen and servicemen, 299; nurses, professional, 274; cashiers, 273; and waiters, 201. These figures indicate the number of new job openings yearly in Kentucky during 1950-60 for the special job types indicated. Numerous additional jobs are given in the table.

In making interpretations of these data for the period 1965-75, it should be considered first of all that a substantially more rapid rate of growth is expected for the period 1965-70 as compared to 1950-60. In addition, there must be taken into account the job replacements which may equal the number from growth in the state's economy.

---

[13] All data are for the net growth in jobs and do not take into account the very large number of openings from worker replacements.

SOURCE: U.S. Census of Population for 1960. Vol. 1, Characteristics of the Population. Part 19, Kentucky, pp. 386-391.

SUMMARY AND CONCLUSIONS

1. The results of the analysis indicate a rising demand for white collar workers related to a significantly high rate of growth of the service industries. The entire group of white collar occupations depends upon a high level of education and skill-training for employment. The professional group requires advanced graduate training; technicians require at least two years beyond high school in a technical institute or equivalent work; and clerical workers must have a high school education in general plus vocational training. The other two categories, managers and sales workers, have mixed requirements of education and training. The conclusion, however, is that the high significance of education and training for the white collar jobs, with rising demand in the future, places an increasing emphasis on education and training for workers. Statistics indicate fewer jobs each year will be available for those with poor education and little training.

2. The relative importance of blue collar workers has been declining and will continue to do so because of the shift in the economy from goods-producing industries to service-producing industries. The second important influence here is the displacement of workers by automatically controlled equipment which is able to increase the output year by year with declining input of labor. Within the blue collar category however there will be a continued good demand for skilled craftsmen in manufacturing, in repair services, in transportation and communications and elsewhere in the economy. Since Kentucky lags the national ratio in the relative importance of manufacturing, the expected more rapid growth of manufacturing employment, catching up with the rest of the nation, will provide a stronger demand for semi-skilled operatives in production and assembly line work. In the skilled occupations it is highly important that workers have a high school education although some are getting by with less, fortified

by a remarkable aptitude for a skill. Possession of a marketable skill is difficult to acquire without good basic education and even more difficult to keep up to changing technology because of great need for intellectual capacity and flexibility. Programs of public education reinforced by company training should make it easier for adult workers to acquire skills and keep them updated.

3. The strongest demand of all is shown for service workers because of the shift of the economy towards an urban culture which places major emphasis on services and related activities in the city. Ability to meet the public, good appearance, neatness, and proper job attitudes are highly important to acquiring and keeping a job in one of these occupations. In the past a high school education has not generally been required but here as elsewhere the premium is to those who perform well on the job, and the background of a high school education is most helpful in achieving a high performance. In the past schools and training agencies have not recognized properly the importance of job attitudes in training for service. But the market demands of the future will require that they do so. Such a reorientation of education and training will probably be one of the most important developments in the years ahead in the training and development of manpower resources.

4. Farm workers will continue to decline but at a much lesser rate than during 1950-60. Significantly, the replacement figures for the older farmers and workers show opportunities for trained farmers and farm workers which are not now fully appreciated. The importance of skilled workers in agriculture will shortly be recognized and new fields of training opened up to meet these demands. Some new thinking may be required on the status and pay scales for such workers.

5. The near stabilization of employment in mining and the staailization of agricultural employment in a decade or so indicate that the impact of a fast changing technology on output of these two industries may be approaching a balance with strong market factors.

6. The distortion of the age structure towards the older workers in Kentucky, as well as in the United States, will make available a significant number of job opportunities aside from those tied directly to economic growth during the period 1965 to 1975. In Kentucky the number of jobs opening each year from retirements and deaths of older workers, age class 45 and over, will equal and probably exceed the number of new jobs developing from expansion in the state's economy, even if Kentucky's growth prospects are assumed on the optimistic side from the standpoint of population, employment, and income. Obviously the job openings and opportunities will be there but in order to obtain and retain them, workers must have good basic education, fortified by a skill acquired through trade school, apprenticeship, or otherwise, and have proper job attitudes on how to find a job, satisfy the employer and keep the employer's customers satisfied.

7. Another factor in the state's future associated with the age distortion of the working force towards the older workers is the impact this will have on middle management and top level executives in industry, trade and government in Kentucky. Since the relatively large number of executives from the older age classes greatly outnumber the potential middle management and top executives in the line of succession from age class 35 to 45, a problem may be developing relative to filling the vacancies. Opportunities are developing, therefore, for institutions of higher learning, and particularly departments of business administration and economics, to offer executive training programs which will enlarge the number of potential executives in the younger age classes of companies.

8. In order to find and hold a job in the future and progress to higher responsibilities and pay, workers at every level of skill and technical competence, including professional engineers and scientists, must keep their marketable skills and technical know-how up to date. This means a broad and expanding program of adult education, first in the high schools and community colleges and secondly in institutions of higher education. Company programs of classroom instruction and on-the-job training are of significance but are perhaps

not of sufficient scope and size to meet anticipated demands in the future.

9. An adequate supply of trained workers and the ability of the state to keep them properly trained and up to date may be the most critical factor determining the rate of industrialization and economic development not only in the immediate future but also in the years ahead. The limitation of sufficient supply of skilled workers and brainpower to company success in solving highly complex, technical and scientific problems, so necessary to company success and survival, is coming to be recognized by some of the leading companies. In a short time it will be recognized by most.

10. Recent data[14] on attendance in elementary and secondary schools and institutions of higher learning, both public and private, indicate that about one-fourth of the entire U.S. population is engaged in formal programs of education. Currently, probably an additional five to six million are participating in public type vocational and technical training programs. Many more are in company training programs or other types of training. All of these perhaps constitute another 5 to 10 percent of the population. Total expenditures on education, both private and public, represent about 5 percent of GNP. Defense expenditures not including foreign aid are about twice as great. Undoubtedly defense expenditures of this size are justified in a world which is under threat of the atomic bomb. And they are not necessarily connected, but surely a rate of expenditure on the development of human resources only one-half as large as for national defense and one-third as large as gross private domestic investment[15] raises questions of perspective.

---

[14] U.S. Bureau of the Census. Statistical Abstract of the United States: 1963. (Eighty-fourth edition). Washington, D.C., 1963, pp. 113, 144-148.

[15] Gross private domestic investment in plant and production equipment is about 15 percent of GNP. Surely investments in human resources deserves equal attention.

APPENDIX

DEFINITIONS AND DESCRIPTIONS OF OCCUPATIONAL CATEGORIES

The occupational classification of the population census is in general comparable with the system used in the Dictionary of Occupational Titles prepared by the U.S. Bureau of Employment Security. There are differences, however. The DOT System is designed primarily for employment service work, such as placement and counseling, and is ordinarily used to clarify any detailed occupational information obtained in an interview with the worker himself. The Census System, on the other hand, is designed for statistical purposes and is ordinarily used in the classification of limited occupational descriptions obtained in a self-enumeration questionnaire or in an interview with a member of the worker's family. Therefore, the DOT System is more detailed and technical than the Census System which is generalized from broad categories of information, often from self-enumeration.

White Collar Occupations

The white collar occupations include: (a) professional, technical and kindred occupations; (b) managers, officials, and proprietors, excluding farm; and (c) clerical and sales workers. These are the occupations which require a minimum of physical work but varying degrees of learning and training, from business school to a Ph.D. from a graduate school.

The professional, technical and kindred occupations include the highly trained scientists, engineers, college presidents and professors. This category also includes the intensively trained and highly specialized technicians who have had in general two years beyond high school in a technical institute. The creative occupations, such as actors, artists and editors, fall in this class. The emphasis here is less on education than creative talent.

Managers, officials, and proprietors, excluding salaried farm managers, include the managers and owners of private business enterprise. The educational background is mixed from less than high school to graduate degrees in business administration or some other management sciences. The important point is that these persons be not only enterprisers but individuals with the capacity to organize, operate and take risk from business enterprises.

People in administrative and managerial work range from proprietors of small businesses to corporate executives. About one-half of all persons in this field are self-employed--most often in retail stores. Salaried officials of business firms make up the second largest group. Several thousand administrative workers are also in federal, state and local government agencies and in nonprofit organizations of many kinds. In addition, buyers, purchasing agents, credit men and many others hold jobs closely related to administrative and managerial work.

The clerical and sales occupations represent a catchall of white collar occupations which are highly essential to the modern economy because of the way they fit into administrative staff in research development, business enterprises, and almost everywhere that records are kept, transactions carried out and sales made. The clerical occupations are the backup for accountants and administrators while the sales workers represent the cutting edge of business enterprise in carrying goods and services to the buying or consuming public. In general a high school education is essential with vocational or business training past high school. A chief characteristic of clerical workers is patience and accuracy with detail, while sales workers must have the ability to promote products or services and deal effectively with the public.

Stenographers, typists and secretaries are the largest specialized group of clerical workers. Bookkeepers are the second largest group. Other large clerical occupations include those of telephone operator, shipping and receiving clerk, cashier, mail carrier and office machine operator.

Sales workers in retail trade are the largest group. Retail trade is an important source of employment for women. Men are employed, almost exclusively, in other types of selling jobs. Other sales personnel include: salesmen employed by wholesalers and manufacturers, insurance agents and real estate salesmen.

Blue Collar Occupations

The blue collar occupations comprise: (a) craftsmen, foremen and kindred workers; (b) operatives and kindred workers; (c) service workers including private household employees; (d) unskilled laborers except farm and mine; and (e) farmers, farm managers and farm workers. Application of skill is characteristic, but this varies from a high degree of skill in the case of craftsmen to practically none for unskilled workers. Major emphasis is placed on physical work in all these occupations.

Craftsmen, foremen and kindred workers represent the occupations which place major emphasis on skills ability, or facility and dexterity to carry out special operations which are not generally routine. They receive training on the job, in trade schools and in apprenticeship programs. Some of the major skilled crafts are bookbinders, brickmasons, carpenters and cabinetmakers, electricians, electrotypers, glaziers, loom fixers, machinists, mechanics and repairmen, millwrights, painters, plasterers, plumbers and pipe fitters, stone cutters, toolmakers and upholsterers. Skilled workers find employment in three broad occupational groups of building trades, metal working, and maintenance work in all operations involving machinery or electricity.

Operatives and kindred workers constitute the semiskilled occupations and are largely associated with production line work. The worker must learn well, a few routine steps, usually on the job. This category also includes apprentices who are in process of being trained as craftsmen. In addition to apprentices some of the most common jobs are assemblers, auto service station attendants, brakemen, bus and truck drivers, chainmen, checkers, conductors,

dressmakers, dyers, graders, knitters, meat cutters, street motormen, power station operators, sawyers, sewers, railroad switchmen, taxicab drivers, weavers, and welders and flame cutters. Job openings occur to a major extent in all types of manufacturing, construction, transportation, wholesale and retail trade, and business and repair services.

Service workers, including domestics, comprise those workers which deal in a service either in public business or private homes. A certain degree of skill is required to dispense service from business establishments but greatest emphasis is placed on ability to deal with the public. Domestic service in homes requires very little facility to deal with the public but great emphasis is placed on dependability and honesty. Skill in using home appliances and a certain knack in cleaning work and in keeping household arrangements are required. Special aptitudes to care for small children and prepare household meals are required in some service type jobs in homes. Typical types of service jobs are: attendants in hospitals, barbers, charwomen and cleaners, cooks, elevator operators, hairdressers and cosmetologists, janitors, practical nurses, ushers and waiters. Domestic service or private household workers include babysitters, housekeepers, laundresses, and charwomen and cleaners.

Unskilled workers except farm and mine include that great mass of workers who have neither training nor skill. Most school dropouts, especially before the tenth grade, can expect only unskilled, low paying jobs, which are becoming relatively fewer in number in the modern economy. A strong back, willingness to put in a full day's work, dependability, reliability, cooperativeness and honesty are the important qualities required to be a success as an unskilled worker.

Farmers, farm managers and farm laborers comprise the entire range of skills and training from the unskilled worker to the college graduate, generally from an agricultural college, operating his own farm or acting as a hired professional on a large commercial farm. Research shows that success in farming is directly related to

application of new discoveries of science and the modern techniques of management to the farm enterprise as a business. The rising capital investments, the need for a broad range of machinery, and the widespread use of fertilizers and insecticides in agriculture are placing an increasing emphasis on trained craftsmen and technicians, such as tractor and truck mechanics, electricians, etc.

*DATA PROCESSING OCCUPATIONS; ELECTRONIC DATA PROCESSING; *OCCUPATIONAL SURVEYS; EDUCATIONAL NEEDS; MANPOWER NEEDS; *EMPLOYMENT TRENDS; *OCCUPATIONAL INFORMATION; *EMPLOYMENT QUALIFICATIONS; SALARIES; BIBLIOGRAPHIES WISCONSIN

The effects of electronic data processing on employment were studied in March 1965, when 101 South Central Wisconsin government and private establishments were surveyed by mail. Of the 89 percent who responded, 58 percent had data processing occupations and provided usable information. According to the survey, there were 50 electronic data processing systems in operation. Establishments surveyed had ordered 16 more systems to be installed in the next 3 years. The activities, education required, training, monthly earnings, and estimated needs of employers in specific data processing occupations are included for the occupational titles listed in the United States Department of Labor's publication "Occupations in Electronic Data Processing Systems." Findings imply that the supply of qualified workers is increasing, and the opportunities for employment may not be as plentiful as in the past. The few opportunities which will occur will be of the type where advanced level (college or university) training will be a virtual necessity. (PS)

WHAT ABOUT DATA PROCESSING?

Considerable attention has been paid recently to the field of data processing. Because of the relatively recent introduction of electronic equipment, the field has had an aura of glamour surrounding it; similarly, it would appear that thus far many economists have tended to over-emphasize the impact positive or negative which this innovation may have on employment trends. The implications suggested by this study, therefore, should prove of interest both as to the outlook for southern Wisconsin and, by projection, for the nation as a whole. It should be of special interest to those contemplating a career in this field and also to anyone concerned with the overall effects of electronic data processing automation on employment.

Generally speaking the outlook, as expressed by the employers responding to this survey, indicates neither cause for extreme concern nor justification for complacency. If employer estimates are correct, great numbers of workers will <u>not</u> be laid off within the next five years; the advent of electronic data processing equipment will not immediately displace a large number of office workers.

There will be exceptions of course. One records-processing branch of the state government ultimately expects to reduce employment by almost 400 clerical workers and a number of employers expect a moderate decline in employment.*

*See Graph on page 7 regarding employers' evaluations of the long-term effects of the introduction of (EDP) equipment.

By and large, though, most employers anticipate a moderate increase in employment in Electronic Data Processing occupations during the next five-year period.

Since the supply of qualified workers is also increasing, anyone comtemplating a future in this field can reasonably expect to find that the opportunities for employment in this type of work may not be as plentiful as in the past, and the few opportunities which will occur will be of the type where advanced level (college or university) training will be a virtual necessity. Employers, in their manpower requirements, seem to be looking for candidates with high degree of potential or competency. It is obvious that this is not the appropriate field for someone with only average or below average ability.

DATA PROCESSING INSTALLATIONS

Rate of Expansion

According to the April 1965 survey there are 50 Electronic Data Processing Systems in operation in Southcentral Wisconsin. Not included in this figure is the unit record equipment used by many firms. Figure I shows the rapid expansion of EDP systems in the last few years. In fact, twice as many computers were installed in 1964 as in any previous year. Naturally, this has meant an expanded opportunity for employment.

FIGURE I

NUMBER OF COMPUTERS INSTALLED BY YEAR

*Two establishments reported computer installations prior to 1959.

This expansion is not at an end. Establishments surveyed presently have on order 16 more systems (EDP's) to be installed in the next three years. Ten establishments are converting from unit record equipment to EDP systems and three establishments are installing data processing equipment for the first time. This should mean opportunities for employment will continue for the next few years.

The Industries

As elsewhere in the nation, "paperwork" industries, i. e., government, finance and insurance, have made the most extensive use of Electronic Data Processing systems. For them, the computer is the answer to the growing mass of paperwork. Therefore, it is not unusual that Madison, with its many government, finance and insurance establishments, would be the location of 43 out of 50 computers counted. As noted in figure II, government predominates with 26 EDP installations, but manufacturing firms have installed six computers in the last two years and eight more are on order.

FIGURE II

NUMBER OF (EDP) SYSTEMS BY INDUSTRIAL GROUP

Location

Government will continue to dominate in the Data Processing picture. Few large manufacturing firms are located in the area and government's need for additional EDP equipment continues. In fact, three computers are now on order by government agencies. As seen in Figure III, opportunities for employment in data processing occupations are predominantly in the Madison area of Dane County.

FIGURE III

LOCATION OF (EDP) SYSTEMS AND DATA PROCESSING OCCUPATIONS

USE OF ELECTRONIC DATA PROCESSING SYSTEMS

A computer is used, for example, to plot cross-sections for future highways, figure the profit on a new line of meat products, and keep track of agricultural records. However, normal business applications (payroll, inventory control and accounting) seem to be the most important application. Eleven companies list Process Control as an application while seven companies service other firms with their computers. Many firms and government agencies (excluding purely research establishments) use their computers over 75 percent of the time for business applications.

Shifts Used

Of the government agencies and departments having computers, our survey shows 68 percent of them operating a second shift and 25 percent of them operating around the clock. On the other hand, only 55 percent of the private establishments having computers use them for two shifts, and only one private establishment reported a third shift operation.

Implications

A computer affects the way work is done throughout a company or government agency. It affects every level of work including management. It may eliminate low skill occupations and perform routine tasks in engineering, accounting, etc., with speed and accuracy--eliminating jobs. On the other hand, the computer allows a a concern to do many things that would be impossible without a computer.

Effect on Employment

The graphs on the following page indicate the relative number of employers who feel that the installation of EDP equipment will have the effect of increasing, stabilizing, or decreasing total employment within their respective organizations, both from a short-term and a long range standpoint. It should be emphasized that the totals represent only percentages of employers, and does not consider the size of the affected work forces. That is to say, the increase or decrease in the number of positions may not bear a direct relationship to these percentages.

Figure IV

SHORT RUN EFFECT OF THE COMPUTER ON OVERALL EMPLOYMENT
Percent of Employers Reporting

FIGURE V

LONG RUN EFFECT OF THE COMPUTER ON OVERALL EMPLOYMENT
Percent of Employers Reporting

A WORD OF CAUTION

Many factors, which at this time appear to be of little significance, may possibly emerge later to have considerable influence. However, at this time, it would appear unlikely that these factors will have any major effect within the next five years.

Chief among these factors would be the invention and introduction of new types of equipment. Optical character recognition devices, for example, may ultimately replace significant numbers of keypunch operators. A substantial time lag will be involved, however, before this equipment is manufactured, installed, and in such general use as to affect large numbers of employees.

With more companies planning data processing installations, the existing shortage of experienced personnel will be intensified for a time. "Pirating" of employees from one firm to another may increase. Employers may be forced to relax hiring restrictions, institute their own training programs, accept partially-trained personnel, or import qualified personnel from other areas. While this situation may exist for a time, it is felt that eventually the picture will stabilize, most probably before 1970, barring the advent of radically different equipment.

This report is also subject to the limitations of the information supplied by its participating employers (to say nothing of those who interpret their data...). Many people involved in the personnel

or data processing area do not as yet have a clear idea of what to expect in the near future. Several employers in fact, mentioned this in connection with their projections; they simply haven't had their equipment in operation long enough to be able to predict long-term effects.

Finally, many employers who have installed modern equipment with the idea of reducing manpower have discovered ways of utilizing this equipment in ways they originally didn't intend, and thus a slight increase rather than a decrease in employment has eventually resulted in certain industries.

The Difficulty in Prediction

Mr. John Diebold, in testimony before the House Subcommittee on Unemployment and the Impact of Automation, said in 1961:

> "In the late 1940's, serious statements were made by very knowledgeable men in this country that all of the computing in the country could be handled by 12 large-scale computers. This was right after the machines had first been built.
> By the end of the fifties the statement that all the computing in the country could be handled by 50 large computers was made, again by a very knowledgeable authority.
> Today, we have 5,000 computers. We will have 10,000 by the end of the decade.*(1)
> The crux of the problem of prediction in this field is that you have a very rapidly moving technology with important

*(1) A February 1965 computer census by Business Automation, a monthly trade publication, revealed 17,457 computer installations in the U. S.

innovations made every few years. Because the development of applications follows the technology, use of the conventional means of prediction is very, very difficult."*(2)

*(2) U. S. Congress, House of Representatives, Committee on Education and Labor. Impact of Automation on Employment; Hearings, 87th Congress; (Washington, U. S. Government Printing Office, 1961), page 72.

MANPOWER REQUIREMENTS FOR UNIT RECORD AND ELECTRONIC DATA PROCESSING SYSTEMS

Eighty-nine employers, including private establishments and government agencies, cooperated with the WSES in determining present employment and future needs in specific Data Processing occupations. The occupational titles included here are those used in the United States Department of Labor's publication Occupations in Electronic Data Processing Systems.

Two exceptions are the titles of Applications Engineer which will appear in the forthcoming publication entitled Occupations in Electronic Computer Systems, and the use of the title Auxiliary Equipment Operator to encompass Dictionary of Occupational Titles -- Card-Tape-Converter Operator, High Speed Printer Operator and the operation of other peripheral equipment.

The occupations listed are grouped into three functional areas of work: Project Planning, Programming, and Operations. Included after each grouping is a section on Education, Training and Experience also taken from the revision of the publication Occupations in Electronic Data Processing Systems prepared primarily by the staff of the WSES Occupational Analysis Field Center.

PHASE I - PROJECT PLANNING

PHASE I is concerned with the overall planning, scheduling, and coordination of activities to process data efficiently. By analyzing the data and the problem, a determination can be made of the cost, manhours, and machines necessary to do the job.

PHASE I OCCUPATIONS AND ACTIVITIES:

Manager, Electronic Data Processing directs and coordinates planning and production activities. He confers with department heads involved in projects to insure cooperation and assigns, schedules and reviews work by the (EDP) department. In general, he assumes overall responsibility for activities of the data processing department.

Project Director, Business Data Processing plans and directs electronic data processing projects. He coordinates planning, testing, and operating phases for each project to assure best use of equipment and manhours. To do this, he must be well informed about all phases of processing data.

Systems Analyst, Business (EDP) analyzes business problems such as inventory control, production control and cost analysis systems to refine the problem and convert it to a machine language. He develops process flow charts or diagrams for the processing of data and may recommend new equipment and methods for efficient processing of data.

Computing Analyst formulates mathematical statement of engineering or scientific problems and devises procedures for solution by data processing.

Applications Engineer analyzes physical systems, formulates mathematical models of systems, and sets up and controls analog computer to solve scientific and engineering problems.

Operations Research Analyst formulates mathematical model of management problems by application of advanced mathematics and research methods to provide quantitative basis for planning, forecasting, and making decisions.

TABLE I
EMPLOYMENT 1965 AND ESTIMATED NEEDS OF EMPLOYERS
BY OCCUPATION

Occupation	Total 1965	Change Between 1965-1967	Change Between 1965-1970
Total	90	+ 24	+ 42
Manager, Data Proc. Systems	35	+ 4	+ 4
Project Dir., Business Data Pro.	6	+ 2	+ 4
Computing Analyst	7	+ 3	+ 9
Applications Engineer	0	0	0
Systems Analyst	36	+ 14	+ 22
Operations Research Analyst	6	+ 1	+ 3

NOTE: Estimated needs, 1970 is a comparison between 1965 and 1970 and includes 1965-1967 estimates.

OUTLOOK: The WSES survey shows a continued, competitive demand for a limited number of these highly skilled people. No data was received on Applications Engineers, probably because of the few analog computers used in the area. Altogether, employers reported 90 people working in those occupations in 1965. The occupations of Systems Analyst seems to have the greatest potential for growth. According to employer comments there is great competition for the services of experienced people. Companies with new installations need experienced men. This provides the greatest opportunity for employment. "Pirating" valuable personnel may increase. To a great extent this depends on the number of new (EDP) systems installed in the near future. The outlook then is good but for a limited number of highly trained people.

EDUCATION, TRAINING AND EXPERIENCE

For the Manager, Electronic Data Processing and the Project Director, depending on the complexities of the applications, courses in Business Administration, Accounting, Engineering or Mathematics with other courses in Electronic Data Processing and extensive experience in data processing work are required. For Project Director, a BBA or MBA in accounting, mathematics and statistics may be required.

For Systems Analysts, Business Data Processing, a college degree with courses in business administration or accounting is usually required without prior experience in Electronic Data Processing. Many employers waive formal educational requirements for workers currently employed in their establishment who have had several years' manual and machine systems experience prior to computer conversion. Currently the trend is to require a knowledge of advanced mathematics because of the increasing sophistication of business systems.

For the Specialist, Computing Analyst, Applications Engineer and Operations Research Analyst, college graduation with a major in mathematics, engineering or the physical sciences are required with advanced degrees desired.

PHASE II - PROGRAMMING

Programming includes an analysis of the detailed process flow as developed in Phase I in order to convert the work or process flow to more refined statements of required machine actions necessary to solve the problem.

PHASE II OCCUPATIONS AND ACTIVITIES:

Programmer, Chief, plans, schedules and supervises preparation of programs. Assigns, outlines and coordinates work of programmers.

Computer Programmer writes the detailed instruction or program for the computer and electronic data processing.

Programmer, Engineering and Scientific converts scientific, engineering and other technical problem formulations to format processable by computer.

Coding Clerk assists programmers in developing application for conversion to machine processing. Converts instructions into special machine "language" or code.

TABLE II

EMPLOYMENT 1965 AND ESTIMATED NEEDS OF EMPLOYERS BY OCCUPATION

Occupation	Total 1965	Change Between 1965-1967	Change Between 1965-1970
Total	135	+ 43	+ 72
Programmer, Chief	18	+ 8	+ 8
Programmer, Business	75	+ 25	+ 39
Programmer, Scientific	13	+ 6	+ 13
Coding Clerk	29	+ 4	+ 12

OUTLOOK: Programmer, Business is and will be by far the employment leader among these occupations, with 75 people employed in 1965 and with an estimated need of +25 people in 1967 and +39 in 1970.

Employment for Scientific Programmers is small, 13 people in 1965. Presently 12 are employed in government research and one is in private industry. Only five employers reported employment of this specialty. Because many scientists write their own programs, little growth in this occupation is expected.

Only two employers showed any expected increase in employment for the occupation of Coding Clerk and currently 29 are employed.

Because of their special skills and aptitudes, both Chief Programmer and Programmer, Business were rated as difficult to fill by seven employers. Some employers commented on the competition between companies for good Business Programmers.

EDUCATION, TRAINING AND EXPERIENCE

Graduation from a technical school with training in business or Electronic Data Processing is the usual requirement for Chief Programmer. A minimum of two years' experience is also required.

Programmer, Business requires a high school education with six months to two years of technical school training in computer operations and in the general principles of programming or the equivalent experience. The current trend is to hire college

graduates with majors in business administration, accounting or mathematics. For computer installations concerned with complex problems such as market research and statistical forecasting, a degree in mathematics is preferred.

For Scientific Programmer a degree in mathematics or engineering is usually required with an M.S. or Phd. necessary for some highly complex work.

PHASE III - OPERATIONS

Operations: "The operating phase is concerned with the actual data processing machine operations that are involved in solving a problem and in obtaining the solution. In many installations all necessary data are transferred directly onto magnetic tape from punch cards or paper tape, and the various data tapes and program instructions are mounted in the pertinent tape units. The system is then put into operation and carefully controlled during each step of the total process. Final results are recorded on printout forms, tapes, cards, or microfilm depending on the needs of the organization." [3]

PHASE III OCCUPATIONS AND ACTIVITIES

Supervisor, Data Processing System supervises and coordinates activities of workers who operate electronic data processing machines.

Console or Computer Operator operates the central control or console of the electronic computer; completes processing of "debugged" applications.

Auxiliary Equipment Operator operates converters, printers and other machines which are a part of the electronic data processing system.

Data Typist operates an electric typewriter equipped with a special keyboard to transcribe coded program instructions or data on paper or magnetic tape.

Tape Librarian maintains files of tapes, classifies, catalogs and cross-indexes reels of tapes.

[3]Wisconsin State Employment Service, Occupations in Electronic Data Processing, (1959 Revised June 1964) P.13

Supervisor, Machine Records Unit plans, coordinates and supervises Electric Accounting Machine data processing unit. Assignes personnel and schedules workflow.

Tabulating Machine Supervisor supervises operators of various punched card data processing equipment.

Tabulating Machine Operator operates various punched card machines--tabulators, sorter, printers, and collators. Interprets written procedures and diagrams. Wires panel boards.

Keypunch Supervisor supervises, trains, directs keypunch operators. Maintains flow and volume of work.

Keypunch Operator performs usual operations of keypunching and verifying data into punched cards.

TABLE III

EMPLOYMENT 1965 AND ESTIMATED NEEDS OF EMPLOYERS BY OCCUPATION

Occupation	Total	Change Between 1965-1967	Change Between 1965-1970
Total	494	+ 67	+ 98
Super., Data Proc. System	22	+ 6	+ 6
Console or Computer Operator	67	+ 16	+ 23
Auxiliary Equipment Operator	16	+ 6	+ 10
Data Typist	7	-	-
Tape Librarian	2	+ 2	+ 2
Supervisor, Machine Records Unit	13	+ 1	+ 1
Tabulating Machine Supervisor*	11	- 1	-
Tabulating Machine Operator*	71	- 4	- 3
Keypunch Supervisor	34	+ 4	+ 12
Keypunch Operator	251	+ 32	+ 47

*Only occupations showing a decrease in number from 1965

OUTLOOK: For many of the above occupations, employers on our survey showed a reluctance to estimate growth. However, from the comments

of many employers, there will be continued growth for all occupations with the exception of Tabulating Machine Supervisor, and Tabulating Machine Operator. The reason for this decline is that many firms are converting from unit record equipment (using tabulating operators) to EDP systems (not requiring tabulating operators), and with the new lower cost Electronic Data Processing equipment being produced, many small firms can now afford a computer.

Only seven people are employed as Data Typists and no employer gave data on projected growth. Only two Tape Librarians are employed but some employers commented that as installations become larger and more complex there will be a continued need for a small number of Tape Librarians.

Keypunch operators are, by far, the largest number employed. A total of 251 people are employed as Keypunch Operators and, of this number, practically all are women. An increase of 39% in employment in the next two years was predicted by those employers giving data on growth.

Turnover: Each year a sizable turnover of keypunch operators occurs as young women leave their jobs for marriage to be replaced by recent High School graduates. As a result this occupation provides work opportunities for many young women.

Women: It should be noted at this time that women are employed almost exclusively in the lower skilled data processing occupations that do not require long, continued experience. Five women are employed in government as Systems Analysts and 16 are employed as Programmers in both industry and Government. While 11 women are

employed as Supervisors of Data Processing Systems, 13 as Console operators, 13 as Auxiliary Equipment Operators and 20 as Tabulating Machine Operators, the major employment area for women is the Keypunch operation which shows a total of over 200 women employed.

EDUCATION, TRAINING AND EXPERIENCE

Occupation	Education	Training
Supervisor, Data Processing System	High School Required	2 years experience or 2 years Technical School
Console Operator	High School Required	Several months to 2 years Technical School 2-4 weeks instructions by equipment manufacturer
Auxiliary Equipment Operator	High School Required	Post High School desirable. May understudy Console Operator
Tape Librarian	High School Required	3-6 months experience as catalog clerk, file clerk, mail clerk or messenger with company is desirable.
Data Typist	High School Preferred Demonstrated Proficiency in typing	1 week training on job
Key Punch Operator	High School Preferred Demonstrated Proficiency in typing	1 week training on job

SELECTION AND TRAINING

Prerequisites To Selection and Hiring: As is typical in many new fields, there are not as yet clearly defined requirements for entry into data processing occupations. Obviously the less complex categories, such as key-punch operators or tabulating machine operators, require much less formal education and more in the way of on-the-job training. For these and similar clerical positions a high school diploma is normally sufficient. As the level of complexity increases however, (such as for programmers), there is a certain confusion of qualifications deemed necessary until in the top level occupations it is again generally agreed that a college degree is a virtual necessity, while an advanced degree is often preferred. Nevertheless, it is important that alternative entry channels be maintained for the exceptional individual who would otherwise be excluded.

In the programmer category people are found to have varying educational backgrounds. When converting to EDP, many employers prefer to train their present employees whenever possible, and this is an excellent approach if they are fortunate enough to have well-qualified employees. One employer, in fact, stated that he has filled all of his new openings by upgrading and training present personnel. For entry into programming, however, a year or more of education beyond high school is generally desirable, and a college degree even more so. As one data processing manager has expressed it, "A good, sharp, high school graduate could learn it (programming)." However, it is generally the case that the "good, sharp" high school graduate capable of learning

programming usually has attended college for at least a year or so, if not for all four years.

The test norms set up both by the business machine manufacturers and the WSES in selecting potential employees appear to be highly selective. For those familiar with the GATB norms, a person with a fairly high level of general learning ability is employed. An employer in industry will also frequently prefer to hire a college graduate who has been trained in some specific area such as accounting, engineering, or math and train him in the fundamentals of programming. This appears more reasonable than training a programmer in the fundamentals of accounting, math, or engineering. Some employers favor college graduates because of their promotional potential since such persons can later be advanced to more responsible positions. While it has been possible in the past for high school graduates to enter the field of programming it would appear that in the future some college training, if not a degree, will be a necessary prerequisite. With the increasing enrollments in colleges and the resultant increase in the number of graduates available, employers may tend to upgrade their hiring requirements.

Mentioned most frequently by employers as a "desirable" background for a programmer is some aspect of working with numbers, such as mathematics, statistics, or accounting. Logic was also considered a valuable background, as was engineering.

Interestingly enough, in the EDP world of numbers, there is a surprising emphasis on communication skills. Report writing, English,

and the ability to communicate were frequently mentioned by employers as being necessary attributes for programmers and higher-level personnel. Among other responses were such diverse subjects as history, music, physics, and languages. "Desirable" traits included analytical ability, the ability to analyze problems, logical thought, love of problem-solving, the ability to envision a yet-unfinished process as it will be in a finished state, attention to detail, and patience. Inventiveness was also considered helpful. "Undesirable" personal traits included carelessness or a lack of interest in detail. Personnel workers, social workers, and sales, marketing, and advertising people were felt to be poor candidates for data processing occupations.

There seems to be very little attention paid to the many small private schools which offer six and twelve week courses in the basics of tabulating machine and peripheral equipment operation. It is generally felt that the employers' on-the-job training programs teach these skills more effectively as they pertain to a particular employer's operations. There is no longer a short-cut to an education in this field; graduates of these short courses can no longer expect to step into programming occupations on a level equal to that of a college or two-year technical graduate.

Aspects of Training: As previously noted, there is a growing tendency to hire college graduates for entry into programming. As a continuation of this education, employers placed heavy emphasis on the equipment manufacturers' schools to teach such

courses as basic computer concepts, programming, and data processing for management. Fully one-third of all responses mentioned this type of education as being necessary to their operations. Almost equal emphasis was placed on formal in-plant training programs, but few employers taught much more than key-punch or tabulating machine operation.

Twenty two percent of the private employers responding mentioned the vocational school as a training institution, but only 12% of governmental responses referred to it. Significant emphasis was placed on the University of Wisconsin for extension courses and management seminars on such subjects as systems applications, programming, numerical methods, and computer operations.

* * *

If conclusions are to be drawn from this part of the survey, it would appear that employers in this field, like those in so many other fields today, are seeking highly intelligent and versatile personnel, generally with an educational background that enhances not only their ability to learn but also their ability to readily adapt to new procedures and situations.

BIBLIOGRAPHY

A considerable amount of literature is available regarding automation and its effect on the economy. However, comparatively few actual studies have been made concerning the employment implications resulting from the introduction of (EDP) equipment. As an adjunct to this report we should like to call attention to certain other reports which might prove interesting to anyone concerned with this subject.

Employment Implications of: (EDP)

1. Indiana Employment Security Division, Data Processing Systems and Employment Expectations: Indianapolis, January 1964.
2. Indiana Employment Security Division, Data Processing - Occupational Facts, June 1964.
3. Wisconsin State Employment Service, Occupation in Electronic Data Processing, 1959 Revised June 1964. This report studies individual jobs within the field and analyzes the qualifications necessary for each of them.
4. The Automation Program Reports of the Automation Manpower Services Program are interesting studies of how automation affects employment within particular companies. Perhaps the most pertinent study would be: United States Employment Service and the Wisconsin State Employment Service, A Large Life Insurance Company Automates, April 1964.

5. United States Employment Service and the Wisconsin State Employment Service, Computers on the Factory Floor, July 1963.

Automation in General:

1. Buckingham, Walter, Automation, New York, Harper & Row, 1961.
2. Dunlop, John T., Automation and Technological Change, The American Assembly, Columbia University, Englewood Cliffs, Prentice-Hall, 1962.
3. Killingsworth, Charles, "Automation", The Annals of the American Academy of Political and Social Science, Vol. 340, March 1962, Philadelphia, The American Academy of Political and Social Science.
4. Somers, Gerald G., Edward L. Cushman and Nat Weinberg, Adjusting to Technological Change, New York, Harper and Row, 1963.
5. United States Congress, House of Representatives, Committee on Education and Labor, Impact of Automation on Employment; Hearings, 87th Congress, Washington, U. S. Government Printing Office, 1961.
6. U. S. Department of Labor, Office of Manpower, Automation and Training, Manpower Report of the President and a Report on Management Requirements, Resources, Utilization and Training, Washington, U. S. Government Printing Office, 1964.

SURVEY PROCEDURE

In March 1965 the Wisconsin State Employment Service surveyed over one hundred Southcentral Wisconsin government and private establishments by mail.

Establishments for the survey were chosen from two lists: one compiled by the help of people working in the field of data processing and the other composed of employers in the area having 100 or more employees. Usable information was provided by 64% of the establishments from the first list and 50% of employers chosen from the second list.

Eighty-nine percent of the employers responded. Fifty-eight percent having data processing occupations provided usable information. Thirty percent had no electronic or electromechanical data processing equipment and eleven percent failed to respond. Follow-up letters, phone calls, and visits were used to obtain this response rate.

The fast pace at which the field is moving, the confidential nature of technological change in the field, the difficulty of projecting needs meaningfully and the problem of identifying the prime source of information within an establishment necessitated recontacts with sixty percent of the employers.

TABLE VI

A Partial List of Competencies in the Areas of the Communication Arts, Mathematics and the Physical Sciences Required of Students Enrolled in Vocational Education Programs at the Secondary School Level.

Dade County Public Schools, Miami, Fla. Vocational, Technical and Adult Education Div.
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Dec64 33p.

*SKILLS; COMMUNICATION SKILLS; *VOCATIONAL EDUCATION; *ADMISSION CRITERIA; MATHEMATICS; *HIGH SCHOOL STUDENTS; CHEMISTRY; PHYSICS

This booklet was prepared to aid school personnel in the selection and enrollment of students in vocational education. Competencies in communication arts, mathematics, and the physical sciences, necessary for successful vocational graduates, were identified by teachers and consultants. If testing and interviews indicate that the student is capable of mastering these competencies, he should be admitted to the program. Fundamental communication arts competencies used in all vocational programs are given. Also included are competency lists for (1) Air Conditioning, Refrigeration, and Heating Mechanics, (2) Architectural Drafting, (3) Automotive Mechanics, (4) Aviation Mechanics, (5) Diesel Engines, (6) Electronics, (7) Industrial Electricity, and (8) Machine Shop. VOCATIONAL, TECHNICAL AND ADULT EDUCATION

VT 01163

To the Reader:

On the pages which follow will be found those competencies in the areas of communication arts, mathematics, and the physical sciences which must be mastered by students enrolled in vocational education programs at the secondary school level if they are to be successful in their chosen occupations.

The attention of the reader is called to the sheet dealing with competencies in the communication arts which all students in all programs of vocational education should have mastered.

Following this sheet will be found a listing of the fundamental mathematical competencies which likewise must be mastered by all students in all vocational programs. Those mathematical competencies required of students enrolled in a specific program will be found listed separately.

The competencies listed for each of the programs presented in the booklet were prepared by a committee or team of instructional and administrative personnel who have had many years both of teaching and of working experience in the occupations presented. The programs analyzed represent a very small percentage of those offered in the Division of Vocational, Technical, and Adult Education in the Dade County Public Schools.

The competencies listed by the team members were determined by analyzing the type jobs, operations, and the trade technology appearing in the course outlines used by the instructors in their day-to-day instructional procedures. A list of the team membership appears on the last page of the booklet.

The information set forth in the booklet was prepared to aid school personnel in the proper selection and enrollment of students in programs of vocational education. After the usual psychological tests have been administered and the results noted as to the student's general intelligence, aptitudes, achievements, interests, personal traits, and occupational preferences, the

competencies of the student should be compared with those listed in the booklet for the particular occupational preference of the student.

If (1) the over-all results of the tests indicate that the student does have the mental ability, desire, and drive to master the competencies listed, and if (2) the results of personal interviews are also satisfactory, the student should be admitted to the program of his choice.

However, if the student is not accepted, further study should be made of his case, and measures should be taken to channel him into remedial classes if it appears that such classes will be sufficient to overcome his deficiencies.

The items of information appearing in the booklet can also be used as a guide to determine the course content for classes in mathematics, physical sciences, and English in which students from the vocational courses are assigned.

The booklet also serves to acquaint the administrative, supervisory, and instructional personnel of the Dade County secondary school system with the manner, and especially the extent, to which the skills and techniques of mathematics, science, and communication arts taught at the secondary level are utilized by the student learner in the vocational program and ultimately as a member of the nation's labor force.

As pointed out in a preceding paragraph, the "team approach" was utilized in preparing the material presented in the booklet and it represents hours of work on the part of each member. Thanks and acknowledgment are therefore extended to each member for his cooperation and contribution in the preparation of the booklet.

FUNDAMENTAL COMMUNICATION ARTS COMPETENCIES USED IN ALL VOCATIONAL PROGRAMS*

I. How To Study

1. Orientation to the study process
2. Improved techniques in the use of study aids
3. Advancing toward maturity in correct study habits
4. Pride in achievement
5. Use of library
6. Use of dictionary

II. Mechanics of English

1. Develop a basic vocabulary as a foundation for future growth
2. Develop spelling ability
3. Construct clear and complete sentences using effective modification and subordination
4. Construct clear and unified paragraphs

III. Reading To Solve Problems

1. To interpret written directions
2. To increase trade knowledge
3. To compare methods within the trade
4. To analyze trade practice

IV. Interpretative Reading

1. To recognize the issues in controversial writing
2. To form critical judgment in controversial writing

V. Reading for Research

1. To make selections of details for report
2. To survey the field of technical authorities
3. To recognize trends
4. To complete research projects

VI. Reading for Pleasure

1. To experience samples of literary types
2. To recognize character delineation, plot development, and emotional content
3. To evaluate literature critically

---

*Taken in part from Resource Units for Teacher of English in Vocational Schools, 4th Year. The University of the State of New York, The State Education Department, Albany, New York.

FUNDAMENTAL COMMUNICATION ARTS COMPETENCIES USED IN ALL VOCATIONAL PROGRAMS (Contd.)

VII. Occupational Oral Expression

1. Simple oral explanations and business telephoning
2. Oral reporting and analyzing
3. Patterns of behavior in public contact
4. Business etiquette

VIII. Social Oral Expression

1. Social conversation and telephoning; good listening habits
2. Discussion and cooperative planning
3. Patterns of social behavior
4. Poise in common social situations

IX. Communicative Writing

1. Writing social and business correspondence to meet uncomplicated situations
2. Writing communications appropriate to a set of given conditions
3. Correct handling of business forms
4. Facility in knowledge and skills of modern social and business communication

X. Narrative Writing

1. Recording personal experiences and observations
2. Writing summaries of narrative action
3. Writing extended accounts of sequential events

XI. Expository and Descriptive Writing

1. Planning and writing brief but clear explanations and descriptions
2. Writing directions, hints, cautions, mechanical functions, etc.
3. Writing reports of technical reading
4. Extended reports on technical subjects

XII. Persuasive Writing

1. Writing opinions clearly and courteously
2. Gathering, judging, and selecting material to support opinion
3. Organizing material for writing to persuade others to action

FUNDAMENTAL MATHEMATICAL COMPETENCIES USED IN ALL VOCATIONAL PROGRAMS

Students in all vocational programs must have a conceptual understanding and the ability to apply the fundamentals listed below to a working situation:

1. Fundamental operation of addition, subtraction, multiplication, and division with:
   a. Whole numbers (integers)
   b. Integral fractions
   c. Decimal fractions
2. Ratio and proportion
3. Treatment of measured data:
   a. Scalar measurement
   b. Angular measurement
4. Simple mensuration:
   a. Linear
   b. Area
   c. Volumetric
   d. Weight
5. Percentage
6. Symbolism - reading, writing, and understanding the language of mathematical expressions

Additional mathematical competencies appear in the column carrying the heading Mathematics on the pages which follow.

AIR CONDITIONING, REFRIGERATION, AND HEATING MECHANICS

Partial Listing of the Mathematical, Chemical, and Physical Science Principles, Laws, and Theories Used by Workers in the Occupation

Mathematics

1. Literal numbers
2. Using formulas
3. Solving linear equations in one variable
4. Fundamental operations on algebraic expressions
5. Quadratic equations in one variable

Chemistry

1. Science of matter:
   a. Structure of matter
   b. Physical properties of matter
2. Basic properties of solids:
   a. Hardness
   b. Conductivity
3. Basic properties of liquids:
   a. Cohesion, adhesion, and surface tension
   b. Capillary action
   c. Viscosity
   d. Buoyancy and specific gravity
4. Basic properties of gases:
   a. Molecular motion in gases
   b. Compressibility and pressure of gases
   c. Atmospheric pressure
   d. Density of gases
5. Industrial application of gases
6. Change of state - gas to liquid or solid
7. Systems of measure (metric - English):
   a. Units of measure
   b. Measurement of length,

Physics

1. Forces and their effects:
   a. Kinds of force
   b. Effort forces and resistance forces
   c. Mechanical advantage of force and speed
   d. Work, power, and efficiency
2. Static electricity and the electron theory:
   a. Electron theory
   b. Positive and negative charges
   c. Producing and transferring static electricity charges
   d. Electrons in motion
   e. Conductors and insulators
   f. Detecting and using electrical charges
3. Magnetism:
   a. Laws of magnets - polarity
   b. Magnetic field
   c. Shielding
   d. Magnetic and nonmagnetic substances
4. Electromagnetism:
   a. Magnetic fields around current carrying wires
   b. Characteristics of electromagnetic fields
   c. Current flow and flux
   d. Function and use of "right-hand rule"

Mathematics

Chemistry

area, volume, time

c. Changing units of measure from one system to another

d. Precision measuring tools and techniques

8. Types, properties, and function of refrigerants

Physics

e. Electromagnetic coils and electromagnets

f. Practical application in air conditioning and refrigeration

5. Electricity in motion (direct current):
   a. Meaning of current flow and its measurement
   b. Electromotive force and its measurement
   c. Controlling current flow (resistance)
   d. Determining values for current, voltage, and resistance (Ohm's law)
   e. Electrical energy at work
   f. Types of circuits

6. Generation, transmission, and distribution of electricity:
   a. Converting different forms of energy to mechanical energy
   b. Principles of generating electricity mechanically
   c. Types of generators and theory of operation

7. Transformer types and their function

8. Three wire system of distribution

AIR CONDITIONING, REFRIGERATION, AND HEATING MECHANICS (Contd.)

Mathematics	Chemistry	Physics
		9. The watt-hour meter
		10. Application of electricity to machines and lighting: a. Motor types, uses, and principles of operation b. Lighting systems, equipment required, and principles of operation
		11. Heat energy - its effect and measurement: a. Sources and nature of heat energy b. Temperature and its measurement c. Systems of temperature measurement d. Techniques of measuring heat energy: (1) Caloric (2) B.T.U. (3) Specific heat values e. Calorimeter, types, function, and principles of use
		12. Expansion, transfer of heat, and change of state: a. Expansion by heat of liquids and gases: (1) Dalton's law (2) Boyle's law (3) Charles's law b. Transfer of heat c. Change of physical state d. Cooling effects of vaporization

ARCHITECTURAL DRAFTING

Partial Listing of the Mathematical, Chemical, and Physical Science Principles, Laws, and Theories Used by Workers in the Occupation

Mathematics

1. Plane geometry - properties of triangles, circles, polygons, parallel lines, right triangle, congruency, and loci
2. Tables and interpolation
3. Graphs
4. Literal numbers
5. Formulas
6. Simple linear equations
7. Trigonometry of the right triangle
8. Simple surveying

Chemistry

1. Structure of matter
2. Physical properties of matter
3. Basic properties of solids
4. Basic properties of liquids
5. Basic properties of gases
6. Theory and application of changes in matter
7. Systems and application of measurement
8. Types, composition, physical and chemical properties, and application of materials used in the construction field
9. Study of bearing values of soils and its relationship to:
   a. Footing sign
   b. Piling requirements

Physics

1. Theory and application of forces and their effects:
   a. Kinds of forces
   b. Effort forces and resistance forces
   c. Mechanical advantage of force and speed
   d. Work, power, and efficiency
2. Theory and application of dynamic and static balance and equilibrium
3. Techniques of determining the center of gravity and its relationship to stability
4. Theory of balancing parallel and angular forces
5. Theory, laws, and application of gravitation, motion, and mechanical movements
6. Types and application of the use of simple and compound machines:
   a. Levers
   b. Inclined plane and wedge
   c. Wheel and axle
   d. Screw thread
   e. Compound gear trains
   f. Pulleys

		21. Theory and applications of expansion, transfer of heat, and changes in state of matter
		22. Types, theory of operation, and application of lighting and sound equipment used in automobiles
		23. Types and theory of operation of storage batteries
		24. Types, function, and theory of operation of electronic tubes and diodes used in automotive equipment
		25. Principles and application of the conversion of the chemical energy of fuel into mechanical energy as it applies to automotive equipment

AVIATION MECHANICS

Partial Listing of the Mathematical, Chemical, and Physical Science Principles, Laws, and Theories Used by Workers in the Occupation

Mathematics

1. Graphs
2. Simple applications in plane geometry as triangles, circles, parallel lines, and the right triangle
3. Accuracy of measurement
4. Tables and interpolation
5. Literal numbers
6. Formulas
7. Simple linear equations
8. Mensuration - conversion of units - English to metric
9. Layout reading and cost estimation
10. Variation - direct and inverse
11. Simple vector analysis
12. Quadratic equations in one unknown

Chemistry

1. Science of matter:
   a. Structure of matter
   b. Physical properties of matter
2. Basic properties of solids:
   a. Hardness
   b. Conductivity
3. Basic properties of liquids:
   a. Cohesion, adhesion, and surface tension
   b. Capillary action
   c. Viscosity
   d. Buoyancy and specific gravity
4. Basic properties of gases:
   a. Molecular motion in gases
   b. Compressibility and pressure of gases
   c. Atmospheric pressure
   d. Density of gases
5. Industrial application of gases
6. Change of state - gas to liquid or solid

Physics

1. Theory of forces and their effects:
   a. Kinds of forces
   b. Effort forces and resistance forces
   c. Mechanical advantage of force and speed
2. Theory of work, power, and efficiency
3. Theory of dynamic and static balance and equilibrium
4. Relationship of the center of gravity and stability
5. Theory of balancing parallel and angular forces
6. Theory of gravitation, motion, and mechanical movements
7. Laws of simple machines:
   a. Levers
   b. Inclined plane and wedge
   c. Wheel and axle
   d. Screw threads
   e. Gear trains

AVIATION MECHANICS (Contd.)

Mathematics

13. Powers and roots

14. Scientific notation - powers of 10

Chemistry

7. Systems of measure (metric - English):
   a. Units of measure
   b. Measurement of length, area, volume, time
   c. Changing units of measure from one system to another
   d. Precision measuring tools and techniques

8. Physical and chemical characteristics of:
   a. Elements
   b. Compounds
   c. Mixtures

9. Theory of chemical changes and reactions

10. Theory of the heat treatment of metals

11. Theory of fractional distillation or refining petroleum products used in aircraft

12. Types and purposes of anti-knock additives used in fuels

13. Types, composition, and uses of dopes, solvents, enamels, glues, and varnishes used in aircraft work

Physics

8. Theory of mechanical power transmission, friction, and lubricants

9. Mechanics of fluids at rest and in motion

10. Principles and application of atmospheric pressure

11. Light and color principles applied to precision measurement

12. The electron theory

13. Theory and application of magnetism

14. Theory and application of electromagnetism in coils and electromagnets

15. Meaning of current flow and its measurement

*PROGRAM DEVELOPMENT; *BUSINESS EDUCATION; *REWARDS; *STUDENT MOTIVATION; HIGH SCHOOLS; *ACHIEVEMENT; BUSINESS SKILLS; STANDARDS

A student may be motivated and stimulated by external objects or situations which give him recognition or status among his peers. One such object is a certificate for proficiency or achievement to provide recognition for a job well done or for evidence of definite improvement. An effective awards program must be based on definite goals for each subject, and these must relate to desirable student characteristics. This brochure describes many characteristics which might be incorporated into a comprehensive awards program. Definite certificate goals are identified for shorthand, office and clerical skills, bookkeeping, record keeping, business arithmetic, social-business subjects, and cooperative work experience. Recognition is provided for accuracy, speed, and office citizenship. Suggested proficiency standards are included for (1) typewriting, (2) dictation and transcription, (3) filing activities, (4) record-keeping, and (5) adding, calculating, and bookkeeping machine activities. The appendix includes a listing of commercial and professional contests and achievement awards. (PS)

Supplementary Information on Instructional Material

Provide information below which is not included in the publication. Mark N/A in each blank for which information is not available or not applicable. Mark P when information is included in the publication. See reverse side for further instructions.

(1) Source of Available Copies:
Agency Publications Distribution Unit, Finance Section
Address State Education Dept, Albany NY 12224
Limitation on Available Copies 5 Price/Unit $.25
(quantity prices)

(2) Means Used to Develop Material:
Development Group Compilation of materials by highschool business dept head
Level of Group state teachers, state supervisors of business education
Method of Design, Testing, and Trial materials provided by Mrs. Gladys V. Hosey of Bethlehem Central School. Editorial, technical assistance by Bureau of Bus. and Distr Education and by Bureaus of Vocational Curric Develorment and Industrial Teacher Training.

(3) Utilization of Material:
Appropriate School Setting high school, area vocational center
Type of Program high school classes in business and distributive education
Occupational Focus general business occupations. Class achievement awards.
Geographic Adaptability No limitation
Uses of Material High school business tchrs. Suggestive for other areas
Users of Material High school teachers in all areas

(4) Requirements for Using Material:
Teacher Competency Regular teachers in business education and other subjects
Student Selection Criteria N/A

Time Allotment N/A

Foreword

Good motivation serves as a strong stimulus to learning. Without adequate and appropriate goals and incentives, many students will fail to put forth their best efforts.

A student may be motivated by a variety of factors. He may be stimulated by conditions within himself which cause him to seek a particular goal. Through self-analysis, he will often seek improvement in characteristics which he considers important and which he believes need some change for the better. He may also be stimulated by external objects or situations which give him recognition or status among his peers. In this instance, a certificate for proficiency or achievement should be used to provide the student with recognition for a job well done or for evidence of definite improvement.

This brochure describes many characteristics which might be incorporated in a comprehensive awards program. This Bureau is indebted to Mrs. Gladys Vadney Hosey, Bethlehem Central School, for bringing together these worthwhile suggestions. Certainly, many teachers will be inspired to initiate or expand an awards program after having read this stimulating presentation by Mrs. Hosey.

Acknowledgment is given to Hobart H. Conover, Co-ordinator of Bureau Publications, for his editorial assistance and to the staff of the Bureau of Publications and the Bureau of Vocational Curriculum Development and Industrial Teacher Training for technical and other assistance in preparing this brochure for publication.

JOSEPH R. STROBEL
Assistant Commissioner for Instructional Services (Vocational Education)

Motivation Through Recognition of Achievement

For business education students, the greatest transition is from school to the initial job. One method of preparing students for this transition is to establish awards which can be linked to the awards to be won on an actual job. On-the-job awards may be verbal approbation, time off, fringe benefits, increased status, or higher salary.

At school, teachers can parallel such recognition by a system of achievement awards. Such awards can be in at least four major categories:

1. Verbal commendation.
2. Favorable written comments on papers, favorable scholarship reports, and report card marks.
3. Job assignments which require additional responsibility, thus giving the student prestige and an opportunity for using his own initiative.
4. Awards or certificates which give the student acclaim among his peers, parents and the general public. The certificate is similar to the practical recognition given by an employer in the form of bonuses, promotions, and better salaries.

Definite Goals Must Be Set

In order to carry out a totally effective awards program on a classroom level, definite certificate goals must be identified for each subject. These goals may relate to a variety of desirable characteristics. Since surveys of businessmen find accuracy near the top of the list of desired employee characteristics, let us begin there.

Recognition for Accuracy

Shorthand I

The skill subjects easily lend themselves to accuracy goals. Beginning with shorthand I, recognition can be given in the early weeks for following instructions in preparing homework and for carrying out classroom procedures. Later, recognition may be based on shorthand penmanship, accuracy with word meanings, spelling, and punctuation based on textbook copy. As students progress to unfamiliar material, vocabulary and spelling words can be added from the dictation copy.

In shorthand I, the time of presentation and the type of certificate will vary with the use of the reading or the writing approach. To be definitive, possible certificates for achievement or improvement might be based upon such factors as the following:

1. Precision in following classroom routine
2. Proficiency in preparing homework
3. Proficiency in spelling and word meanings
4. Facility in penmanship
5. Memorization of word signs
6. Facility with easy phrasing
7. Knowledge of shorthand theory

PROGRESS.
Date
Instructor

An award for accuracy

8. Accuracy in transcription of textbook notes
9. Accuracy in transcription of practiced material
10. Accuracy in transcription of unfamiliar material
11. Definite improvement in any of the above categories

A certificate for following classroom routine might be based upon the student's compliance with certain prescribed procedures. For example, prescribed classroom routine might include having two notebooks, one for homework, one for class use; having a pen or several well-sharpened pencils; homework papers dated and identified by name, period, and assignment number; homework papers folded through the center and passed forward each day without request from the teacher.

The award for proficiency in the preparation of homework would be based upon a notebook that is properly dated, separated with an elastic band or clip, and ready on a desk cleared of extraneous material. In classrooms equipped with tapes and records, students might be expected to utilize the record or tape for practice while the teacher is completing routine details.

Shorthand II and Transcription

In shorthand II and transcription the measurement of accuracy can be based on all the skills of transcription, either individually, such as spelling, word meaning, grammar, punctuation, and capitalization, or on accuracy as a whole, as judged by transcription of mailable copy. Other proficiencies which can be measured for accuracy in shorthand II are typewriting, proofreading, and techniques for correcting typewritten work. This latter recognition of proficiency would be based upon the ability to read accurately for context, make corrections by squeezing or spreading letters, make permissible strikeovers, make neat erasures, etc.

A variety of suggested goals for shorthand II follows:

1. Proficiency in the fundamentals of English
2. Accuracy in typewriting
3. Proficiency in correcting typographical errors
4. Proficiency in proofreading
5. Proficiency in transcribing mailable letters from previewed material
6. Proficiency in transcribing articles
7. Proficiency in transcribing mailable letters from unfamiliar material
8. Proficiency in transcribing office-style dictation
9. Proficiency in supplying omitted words by context

10. Proficiency in specialized shorthand dictation (law, medicine, banking, etc.)
11. Definite improvement in any of the above categories

All certificates at this level should be based on completing the required work on a standard which a future employer would expect and demand. A simple mailable-letter standard, for example, would avoid the errors listed on the next page.

COMPETENT TYPIST
certificate

_____
having demonstrated ability to type accurately at the rate of words a minute is declared by the Examining Committee of The Gregg Awards Department to be a competent typist, and awarded this certificate in recognition of superior skill.

Teacher — Director, Awards Department

Certificate of Credit

This Certifies that _____
has completed a _____-year course in 20th Century Typewriting in _____
and achieved a speed of _____ gross words a minute or _____ net words a minute.

In Testimony Thereof, this Certificate of Credit is awarded on this ____ day of _____ 19____

APPROVED BY — SOUTH-WESTERN PUBLISHING CO., INC.

Teacher — Secretary

Commercially developed certificates

Mailable-Letter Standard

Any one of the following errors will make a letter unmailable.

1. Spelling error, including incorrect syllabication
2. Uncorrected typographical error, including errors marked but not corrected, strikeovers, and errors corrected with pen or pencil
3. Error in grammar
4. Serious punctuation error, including failure to paragraph correctly
5. Sentence error, including incomplete sentences and terminal punctuation in wrong places
6. Serious deviation in wording, altering the original meaning
7. Untidy erasures
8. Poor placement, including uneven right margins
9. Omission of initials and enclosures when required

Office and Clerical Skills

There are myriad possibilities for accuracy awards in office practice and clerical practice classes. Units in filing, mechanics of letter writing, mail routines, interoffice communications, and arithmetical computations have innumerable opportunities for awarding certificates based on accuracy. In the area of typewriting alone, the writing of symbols, figures, and the division of words can be added to the basic skill requirements for typing ABC's.

In a study completed by James L. Clark, Los Angeles State College, on the skill needed in typewriting by prospective secretarial and clerical personnel, 92 per cent of the companies reporting indicated the use of straight-copy timed writings rather than production-type preemployment tests.

> Most of the testing (92 percent) was done on straight-copy timed writings. Sixty-seven percent used five-minute timed writings, while 25 percent used either 10- or 15-minute timed writings. . . . For positions in 75 percent of the companies, prospective employees could make only .4 of an error a minute. An accuracy standard of .7 of an error a minute qualified applicants for positions in only 25 percent of the companies.[1]

In view of these findings, it would seem that the first certificate for students in the office skills area should be based on a series of certificates with emphasis on strict accuracy, beginning with 1-minute and continuing with 3- and 5-minute writings. Later, with 10- and 15-minute timings, 95 per cent accuracy might be considered an appropriate accuracy standard.

---

[1] James L. Clark. "Are Classroom Typewriting Standards Compatable With Office Standards?" *Business Education Forum.* December. 1962. p. 23.

Use of Prepared Materials. A variety of free materials which may be used effectively in connection with the awards program is available to the business teacher. The magazine *The Business Teacher,* for example, publishes exercises in filing which can readily become the basis for an award for accuracy in filing or for an award based on both speed and accuracy.

The *FBE Bulletin* lists sources of free material for drills in speed typewriting, proofreading, and office-style typewriting. The office-style exercises, " A Typist's Day in the Office," are supplied free in folder form for each student. Six varieties of office typing are covered: Form letters, addressing, centering, tabulation, telegrams, and rough drafts. These exercises may be used as the basis for awards in each category, or they may be used in total as the basis for an award in office production typewriting. The packet, " A Secretary's Day in the Office," covers the six previously listed varieties of office typewriting, plus an exercise in following directions and a computation project. Since these eight jobs are integrated into one project, the total project is well suited as the basis for an award in office production or for eight separate awards in the areas represented.

GEOGRAPHIC

CERTIFICATE OF ACCOMPLISHMENT IN GEOGRAPHIC FILING

Ann Lord

having successfully passed the Official Gregg Test on Geographic Filing, published in Business Teacher magazine, and is therefore issued this certificate in evidence of having demonstrated thorough knowledge of the rules, principles, and procedures for indexing, coding, and filing business correspondence in correct geographic order.

Audrey Schmidt

TEACHER DATE DIRECTOR, GREGG AWARDS SERVICES

Gregg Award Certificates are nationally recognized.

Problem-Solving Subjects

In the problem-solving subjects of bookkeeping, record keeping, business arithmetic, and business law, accuracy may be the basis for several types of awards. In these subjects, it is important that students be able to read or listen to a posed problem and then be able to analyze its content, breaking it into its component parts for ultimate solution. The fundamentals of arithmetic, spelling, and word meanings are also logical bases for accuracy certificates. As a class progresses to a specific unit involving business papers, types of business organization, taxes, insurance, payroll procedures, buying and selling, and financial reports, award certificates may be provided to suit the emphasis of the particular project. Schools which make use of various basic office machines in certain of these subjects may also set goals for the proficient operation of these machines.

Awards in the problem-solving subjects might, therefore, be based on any one of the following types of achievement:

1. Knowledge of specialized terminology
2. Accuracy in mental arithmetic
3. Accuracy in problem solving
4. Knowledge of modern payroll procedures
5. Preparation of income tax forms
6. Proficiency in interpreting financial reports
7. Knowledge of banking services and procedures
8. Proficiency in the preparation of financial reports
9. Accuracy in handling cash and cash records
10. Skill in preparing a budget
11. Definite improvement in any of the above categories

Item 9 above might well serve as the basis of an award for handling the money of an actual school function, such as a magazine drive, a school dance, a charity drive, or a club activity. For schools that have a store, awards might be made for the most efficient cashier, inventory clerk, bookkeeper, or salesman. There are also unlimited opportunities for awards for originality in merchandise display. A contest might be arranged based on a specific theme — Father's Day, graduation, Valentine's Day — or, perhaps, a regularly recurring award might be made for the " Best Display of the Month."

Social-Business Subjects

The social-business subjects — introduction to business, consumer education, business management, salesmanship, and business law, for example — emphasize at least four fundamentals: Listening, reading, writing, and speaking. Awards may, therefore, be logically based

on proficiency in word usage, the ability to listen and read critically, to take notes accurately, to locate desired facts, and to draw logical conclusions.

The following is a limited list of bases for possible awards:

1. Penmanship
2. Ability to follow instructions
3. Clarity and originality in writing
4. Proficiency in spelling
5. Proficiency in note taking
6. Skill in oral presentation
7. Improvement in reading rate
8. Improvement in reading comprehension
9. Proficiency in drawing conclusions
10. Improvement in critical listening
11. Notebook organization and design
12. Sales demonstration or sales manual
13. Report writing
14. Definite improvement in any of the above categories

Co-operative Work Experience

Awards for students who participate in co-operative work-experience programs may become a joint effort of employer and teacher. Awards may be based on the informal student evaluation made with the usual job observation sheet, plus discussion with the employer. Awards may be based on 100 per cent attendance on the job, punctuality, co-operation with employer, superior on-the-job production, superior attitudes toward job and fellow workers, excellence of appearance and personality, growth in poise and maturity, etc. In the areas of skill, awards might be made for speed and accuracy in typewriting and shorthand, efficiency in the operation of office equipment, and facility with clerical details.

Recognition for Speed

Business education has long had speed goals in the various skill subjects. Many schools have provided certificate awards based upon speed achievement in typewriting and shorthand, for example, for many years.

Shorthand

In the early stages of shorthand writing skill, student achievement frequently involves the appraisal of speed in reading, followed by speed in writing, and finally transcription. The teacher's manual for Gregg shorthand has suggested goals for reading speed liberally interspersed throughout the text. Teacher's handbooks also suggest specific speed goals for reading, writing, and transcribing.

Initially, awards in shorthand might be based on the student's *reading rate* from textbook copy or prepared work, of brief forms, and of common phrases. As the semester progresses, she can also be judged on her ability to read from unprepared work. Certificates might be awarded for reading rates, beginning at 20 words per minute and continuing for rates of 150 or more words per minute.

Soon after students begin taking dictation, a similar series of certificates may be established for *speed in writing*. This series would probably begin with certificates for writing 60 words per minute.

During the second semester, certificates for *dictation and transcription* may be introduced. These awards will probably follow the usual pattern of dictation — first from prepared material, then from previewed copy, and ultimately from unfamiliar copy. A base speed of 60 words per minute is recommended, with the top certificate award limited only by the ambition and ability of students.

Typewriting and Office Skills

In the broader-based subjects, such as typewriting, office practice, and secretarial practice, speed recognition may begin with timings on straight paragraph copy and progress to simulated on-the-job production measurement. Intermediate speed goals may also be established for such activities as addressing envelopes, typing duplicator masters, typing tabulated material, proofreading, and the like. On subsequent pages, a description of standards on various activities is provided. Of course, speed goals are usually set by manu-

facturers for the use of adding-calculating, bookkeeping, voicewriting, and other machines. A simple solution is to write to manufacturers for a prescribed program of instruction and tests designed to measure proficiency on the particular machine.

Free materials, previously mentioned as obtainable from the Foundation for Business Education, are well-suited for speed as well as accuracy awards.

Bookkeeping, Record Keeping, and Business Arithmetic

In subjects such as bookkeeping, record keeping, and business arithmetic, awards can be initiated for speed in the fundamentals of arithmetic, in mental computation, and in the skillful use of arithmetic short cuts. In problem solving, goals may be set for speed in reading and analyzing problems, for outlining the steps preparatory to solving a problem, and for the actual solution.

Some specific speed goals in this area might include:

1. Mental calculations
2. Facility with arithmetic short cuts
3. Fundamental computations
4. Preparation of financial statements
5. Preparation of a work sheet
6. Analysis of financial statements
7. Handling and recording business papers
8. Use of computational machines
9. Problem solving
10. Definite improvement in any of the above categories

Many of the exercises and tests provided for the skill subjects by publishers may be used as the basis for speed awards. Probably the best known of these tests are those available from the Gregg Publishing Division of McGraw-Hill Book Company, Inc., in the monthly magazines *Today's Secretary* and *Business Teacher*.

The bulletin *The Importance of Business Information to People in All Occupations*[2] will also be of assistance in planning awards for students in the nonskill or basic business subjects.

SOUTH-WESTERN PUBLISHING CO. INCORPORATED SEAL TENNESSEE CINCINNATI, OHIO

South-Western Publishing Company

Approved by

Secretary

Publishers frequently provide certificates to schools that use their texts.

Recognition for Office Citizenship

From time to time, surveys tell us that more people are discharged because of poor personality traits than for lack of skills. It behooves us then to establish attainable goals for our students in the areas of personality traits and physical appearance.

Probably all awards, including those pertaining to appearance and personality, should be based on *individual improvement.* This criterion eliminates competition by natural endowment, thus making recognition possible for all students, regardless of material possessions or inherited physical characteristics. Selection and care of clothing, grooming, and manner of speech should be included in one's appraisal of personality and appearance.

Use Rating Scales To Motivate Improvement in Personal Appearance and Personality

Scarcely a textbook or workbook is published in the office skills which does not include rating scales on many phases of personal appearance and personality improvement. Why not use such a rating scale as a starting point for an awards program in this area?

Another immediate source of rating scales of this type will probably be your teacher of homemaking, physical education, or hygiene; your school nurse or your guidance counselor.

In many schools, a composite personality record may already be in use. Such charts, when completed for a student by each of his teachers, often are made a part of his permanent record folder. A trend in a particular trait thus becomes readily discernable.

Many cosmetics manufacturers and publishers of teen-age magazines also supply free rating scales and tips on grooming and personality to each member of a class. Of course, commercially published rating scales and personality inventories are available from many research institutes.

In using such a scale as the basis of an award, it is advisable to motivate the student toward self-improvement by having him first rate himself. Follow this step by a rating by fellow students and teachers. From this composite rating, a student will have a graphic analysis of aspects of his personal appearance and personality which he should seek to improve. A rerating might be scheduled at regular intervals, and certificates awarded to those students who have shown appreciable improvement.

Health Habits

Certificates for improvement may be made for a variety of other aspects of good office citizenship. The role which health habits play, therefore, should not be overlooked. Would it not be worthwhile to give recognition to those students who observe good health habits, including such items as good dental care, balanced diet, adequate rest, sufficient exercise, and good personal hygiene. A wealth of free material can be obtained from product manufacturers and insurance companies to assist the teacher. Again, self-evaluation should be the initial step.

Work Habits

The transition from the importance of health habits to the study of work habits is an easy one, for often good health is the cornerstone of good work habits. The first and foremost award might be based on the student's record of attendance and punctuality.

Now that the student is present and on time, is he well organized and businesslike? Does he follow directions and work well with others, or does he become discouraged easily? Does he seek assistance or waste time floundering? Does he accept criticism well? Does he profit by his experience? Does he accept responsibility for his job? Does he help others when his work is done? Does he take care of equipment? Is he careless with supplies? Is he careless of time? These are some of the factors that should be considered by the teacher in this evaluation.

Stress Improvement

Mauree Applegate, in his book *Everybody's Business — Our Children,* states: "It is a parent's and a teacher's business to accept children's endowments, which they cannot do much about, and to work on children's habits, about which they can do a great deal."[3] By breaking down the final goal of "ideal businessman or woman" into attainable steps, can we do a great deal? Perhaps certificate awards made for improvement in specific work habits and personality traits will help students to move forward.

Awards might be made for definite improvement in:

1. Grooming and appearance
2. Physical alertness and health habits
3. Social responsibility
4. Poise and confidence

BETHLEHEM CENTRAL SCHOOL DISTRICT
BUSINESS EDUCATION DEPARTMENT

This proficiency award is presented to:

_____

in _____

FOR _____

_____

_____
Instructor

_____
Principal

Date _____

This locally developed certificate is adaptable to many uses.

Maintain an Achievement Record

Students should be encouraged to keep an achievement album or file. The art department of the school will undoubtedly assist with the design of a sample album. With this album as a model, each student should create an individual folder that includes the various certificates that have been earned. If the teacher desires, the album may be divided into sections for (1) local school awards, and (2) area, State, and national forms of recognition.

In-school certificates will usually reflect the wider range of proficiencies that have been discussed earlier. A variety of forms of achievement is also recognized by the certificate awards issued by such organizations as FBLA (Future Business Leaders of America), DECA (Distributive Education Clubs of America), NOMA (National Office Management Association), and textbook publishers.

EBTA Certificates of Proficiency

The EBTA (Eastern Business Teachers Association) is planning to make available certificates of proficiency to be awarded for achievement in the various store and office skills. The vocational standards upon which these certificates are awarded are set up by each local school and checked with businessmen in the community. By the use of tests, school grades, teacher judgment, and any other means the school feels is expedient, students may be "certified" and awarded the EBTA Certificate of Proficiency.

In order to help local schools arrive at reasonable standards, the following standards are indicated by EBTA for consideration:

Typist: 40–80 minute test, consisting of a 5-minute timed writing and typical typewriting tasks. Certification is to be determined by a standard set by the teachers and/or local employers.

Stenographer: 10 minutes or more dictation of letters, at 80 words per minute. Transcription time should be determined by the local school and computed at a minimum of 15 words per minute. The control of the transcription time can be achieved by selecting certain letters, such as 1, 4, 6; 2, 3, 7; to be transcribed.

Bookkeeper: 40–80 minute test, involving the ability to record in original books of entry and use these data to make statements and interpret the results

Machine Operator, Retail Salesperson, etc. 40–80 minute tests which sample typical on-the-job activities

The Eastern Business Teachers Association will provide a supply of pocket-size accredited certificates as a service to its members upon application and affirmation of intention to develop fair standards and administer this program judiciously. Announcement concerning this program will be made by EBTA in the near future.

Federal Civil Service Certificates

Under certain circumstances, arrangements may be made for teachers to issue to students a certificate of proficiency (on a special Civil Service Commission Form) attesting to the ability of a student to type or take dictation at a speed required of applicants to the Federal civil service position of stenographer or typist.

The certificate must show that the student, not more than 6 months previous to the filing of the certificate, demonstrated the required proficiency to a teacher of typewriting or stenography in a public, parochial, or private 4-year high school, or an accredited institution such as a business school, junior college, or college. The typewriting or stenography portion of the written tests will not be required of applicants who are able to present such a certificate.

Business teachers should inquire of local offices of the United States Civil Service Commission for more detailed information on minimum requirements of the shorthand and typewriting tests used in issuing these certificates.

3- to 5-digit units	1 problem	100	2

Appendix 2

Summary of Contests and Achievement Awards

- Administrative Management Society (formerly National Office Management Association) (Local Chapter)

  Spelling Program. The program includes two lists of 600 frequently misspelled words. Tests are administered by the teacher. Students are awarded attractive certificates. Multiple copies of spelling lists are furnished for students, as well as the tests and certificates. The program is made available in the fall.

  Arithmetic Program. The program consists of typical problems encountered in business. Students who complete tests with 100 per cent accuracy are awarded certificates. This program is made available in the early spring.

  Outstanding Business Students of the Year. Procedure is determined by each local chapter. Teachers of the local school choose the senior to be designated as the outstanding business student of the year. Presentation of appropriate certificates is made to each student.

- American Book Company
  Attention: S. S. Stalter
  55 Fifth Ave., New York 3

  For students using *Typing Simplified,* this company will send information on procedures for the National Typing Contest.

- Dictation Disc Company
  170 Broadway
  New York 38, N.Y.

  Information on contests is given in the regularly published pamphlet *DDC Record.*
  The DDC Shorthand Improvement Award consists of an emblem pin given to one student in each shorthand class who, in the teacher's judgment, has made the greatest improvement during the school year.

- EBTA Certificate of Proficiency
  William M. Polishook, Chairman
  Assistant Dean, College of Education
  Temple University
  Philadelphia, Pa.

  Standards for making this certificate award are established by the local school. EBTA will supply a pocket-sized accredited certificate for each student. These certificates of proficiency are supplied as a service to EBTA members upon application and

affirmation of intention to develop fair standards and administer the program judiciously.

- Facit National Contest Committee
  235 East 42d St.
  New York 17, N.Y.

  A medal is awarded to the writer of the best errorless paper in each typewriting class entered in the Facit Accuracy Contest in Typewriting. Several hundred typists participate in regional contests held throughout the United States. The 10 best typists are invited to New York City for the final competition. Contestants and their teachers are the guests of Facit for this trip. An all-expense-paid trip to Sweden is awarded as a grand prize to the winner of the national competition.

- Gregg Awards Program
  Gregg Awards Department
  330 West 42d St.
  New York 36, N.Y.

  Baltimore, Md.

  Typing and filing awards

- Sears, Roebuck and Company

  This award is made by the Sears, Roebuck Foundation through the State Education Department. One $50 U.S. Savings Bond is available to each New York State high school conducting an approved, reimbursable, co-operative, part-time distributive education program. The following factors are considered in selecting the award winner: Scholarship, leadership, job performance, good citizenship. Local teachers and schools select the recipient.

- South-Western Publishing Company
  512 North Ave.
  New Rochelle, N.Y.

  Bookkeeping Awards. These awards are made to students using the *20th Century Bookkeeping and Accounting* text. This company will send a booklet describing procedures for obtaining: (1) pins, (2) certificates of credit (free), (3) certificates of proficiency (free), (4) roll of honor (free), and (5) chart.

Typewriting Awards. For students using *20th Century Typewriting,* this company will send a booklet describing procedures for obtaining: (1) pins, (2) certificates of credit (free), (3) certificates of proficiency (free), (4) roll of honor (free), and (5) speed chart (free).

Filing Awards. For students using *Business Filing,* there are free certificates of proficiency.

- Underwood Corporation or Local Dealer
  Education Department
  1 Park Ave.
  New York 16, N.Y.

  The Underwood School Awards Program consists of awards of merit in the following classifications: Best Typist of the Year; Outstanding Underwood Calculating Machine Operator; Outstanding Business Education Student. Local teachers and the school select the recipients. Each winner receives a certificate and a medallion.

- Foundation for Business Education, Inc.
  P.O. Box 7, Lenox Hill Station
  New York 21, N.Y.

  This organization publishes the *FBE Bulletin,* edited by Louis A. Leslie. Some member-clients of the Foundation for Business Education offer prizes for letters written about their products. The teacher decides which is the best letter and sends it to the appropriate company. Examples of companies providing prizes for business correspondence in 1962–63 are:

  National School Service Bureau
  National Blank Book Company
  Holyoke, Mass.

  W. A. Sheaffer Pen Company
  Fort Madison, Iowa

  Dictation Disc Company
  Department F16
  170 Broadway
  New York 38, N.Y.

  Faber-Castell Pencil Co., Inc.
  41 Dickerson St.
  Newark 3, N.J.

  Miss Jane Creel
  Department 16–511 FBE
  Lever House
  390 Park Ave.
  New York 22, N.Y.

- Future Business Leaders of America
  1201 16th St. NW
  Washington 6, D.C.

  Each year a special awards program is designed to honor those chapters with the most outstanding program in designated areas. Details are supplied to each chapter during the fall through the FBLA newsletter, *Future Leader*.

- Distributive Education Clubs of New York State
  Mr. E. John Gradoni
  Associate in Distributive Education
  Bureau of Business and Distributive Education
  State Education Department
  Albany, New York 12224

  Contestants from local DECA chapters meet at the annual statewide DECA Leadership Conference, to determine finalists who will represent New York State at the National Leadership Conference of the Distributive Education Clubs of America in Chicago, Ill.

  First-, second-, and third-place trophies, as well as certificate awards, are given for the following types of activities: merchandise information manual, chapter activities manual, area of distribution manual, creative marketing project, DECA chapter of the year, advertising layout, and copy writing, display judging, sales demonstration, job interview, public speaking, merchandise mathematics, DECA sweetheart, and DE student of the year.

  See also *DECA Contests and Award Manual,* High School Division, Distributive Education Clubs of America, 1010 Vermont Ave. NW, Washington 5, D.C. This manual, available at $1 per copy, describes in detail the purposes, specifications, and judging standards for each of the sanctioned contests. It also provides illustrations of the various awards available to DECA members.

*OCCUPATIONAL SURVEYS; STATE SURVEYS; *LABOR FORCE; *MANPOWER NEEDS; EMPLOYMENT OPPORTUNITIES; EMPLOYMENT TRENDS; OCCUPATIONAL CLUSTERS; GEOGRAPHIC REGIONS; ECONOMIC FACTORS
NORTH CAROLINA

A stratified random sampling technique was used to select 2,000 establishments from 17 industrial segments. The 1,442 usable returns accounted for employers of 40 percent of the state employees covered by workman's compensation. The data were inflated to represent 8,476 establishments, employing more than 125,000 people and then was adjusted to September 1963. Findings by geographic area were: (1) Area 1 ranks highest in manufacturing, tourist trade, and auto dealer-service industries, third in unemployment rate, and has an estimated 14 percent increase in occupational employment by 1966, and the most need for auto mechanics, (2) area 2 has one-fifth of state's employment, highest weekly wages, heavy employment in insurance companies and clothing stores, an estimated 20 percent employment gain by 1966, and a strong demand for sales workers, (3) Area 3 has lowest unemployment rate, second highest weekly wages, and highest projected employment gain by 1966, (4) Area 4 has an estimated 15 percent employment gain by 1966, need for sales and clerical workers, (5) Area 5 has fewest insured workers, lowest weekly wages, second highest unemployment rate, estimated employment gain of 10 percent by 1966, and need for general salesmen and auto mechanics, (6) Area 6 has highest unemployment rate, estimated employment gain of 12.6 percent by 1966, and need for sales workers and mechanics. Estimated employment growth in surveyed industries, 1963-1966, was: (1) all industries, 16.2 percent, (2) trades, 16.4 percent, (3) finance, 12.4 percent, (4) insurance, 23.3 percent, and (5) service, 11.8 percent. This amounts to a 3-year increase of 21,000 new jobs. (EM)

ACKNOWLEDGMENTS

The development of this Study of future job opportunities and training needs for 54 selected occupations in 17 nonmanufacturing industry segments results from the contribution of time and composite thinking of more than 1,400 employers and their staffs, who responded to mail questionnaires. To each of these contributors, representative of many types of businesses, we are most grateful. Special thanks go to the following employers, who were personally interviewed by Labor Market Analysts, and who provided information and suggestions regarding Study design and methods for collecting the major portion of survey data by mail questionnaire.

FOREWORD

This Study was directed toward obtaining a measure of job opportunities in a cross-section of North Carolina's service and other nonmanufacturing industries. It complements the "North Carolina Study of Technical and Skilled Manpower" of June, 1962, and the "North Carolina Study of Manpower and Training Needs for Medical and Health Occupations" of September, 1963. These three combined studies present labor supply and demand information representing more than 19,000 North Carolina firms which employ about 755,000 persons. These three studies cover 170 different occupations. By 1966, employers in surveyed industries covered by the three studies estimate they will require about 45,000 additional workers for expansion and replacement needs for these 170 occupations—needs over and above the workers employers expect to train on the job.

Merely establishing the fact that job opportunities and training needs exist will not solve the problem of labor supply and demand imbalances. Future planning and cooperative action will be required of employers, staffs of training facilities, educational administrators and personnel of agencies concerned with manpower development and utilization. In this way, a more ample supply of qualified workers can be provided for shortage occupations.

This Study includes an economic synopsis of North Carolina, highlights of survey results, and features a Statewide and area view of industrial and occupational employment findings. The Appendix contains information on methodology and scope, definitions, and additional tables.

STUDY HIGHLIGHTS

- During a three-year period ending in the fall of 1966, total employment in all surveyed industries is expected to increase by about 16 per cent, from 132,200 in 1963 to 153,650 in 1966. This anticipated growth is at a rate slightly greater than the growth rate experienced from September of 1960 to September of 1963 in the group of surveyed industries.

- The following industries are expected to grow at rates greater than 16 per cent by the end of 1966.

Industry	Anticipated Per Cent Growth, 1963-1966
Automobile Dealers & Gas Service Stations	21.3
Women's Ready to Wear Stores	17.2
Eating & Drinking Places	16.4
Credit Agencies Other Than Banking	17.4
Security Brokers & Dealers	20.6
Insurance Carriers	24.4
Insurance Agents, Brokers & Service	18.2
Automobile Repair Shops	18.1
Electrical Repair Shops	42.0

- Twelve of the seventeen industry groups expect greater percentage increases in employment during the 1963-1966 period than they experienced during the period from 1960 to 1963.

- The projected rate of employment growth in surveyed occupations, during the forecast period to 1966, is expected to be slightly higher than the total increase in employment in the industries studied. An expansion rate of nearly 18 per cent is indicated, as employment is expected to increase from 96,900 at survey time to about 114,300 by 1966.

- Employers estimate that by the fall of 1966 about 28,000 new job opportunities will develop in the occupations surveyed. More than 60 per cent of these new jobs will develop because of business expansion.

- On-the-job training programs are expected to provide less than 40 per cent of all workers needed in the occupations studied.

- By the fall of 1964, 7,700 more workers will be needed in the selected occupations for expansion and replacement, than are expected to be trained on-the-job. In the occupations studied, on-the-job training is expected to fall 17,000 workers short of the total demand by the fall of 1966.

- The greatest rate of growth among major occupations studied was found in skilled occupations. By late 1966, employment is expected to increase by about 28 per cent in the skilled category, compared to expected gains of less than 14 per cent in semiskilled jobs.

- Net additional-worker shortages of more than 500 are anticipated in each of 13 of the 54 surveyed occupations by the fall of 1966.

- Eleven other occupations will require more than 200 workers in addition to those trained by employers on-the-job by the 1966 forecast date.

- Employers in surveyed industries expect a surplus of more than 60 bookkeeping machine operators by the fall of 1966.

CONCLUSIONS AND RECOMMENDATIONS

The results of this study emphasize the increasing importance of nonmanufacturing industries in North Carolina's economy. The number of jobs available in these businesses will continue to increase with the over-all economic development of the State. The development of training programs for jobs found in nonmanufacturing industries should keep pace with vocational training which is provided for production workers. In so doing, a wider range of job opportunities will be made available to those individuals in need of work, and employers can be furnished with the types of trained workers which are needed to insure a prosperous economy.

Of equal importance is the fact that the trade, finance, insurance and service industries provide a variety of types of work for individuals having varying levels of ability and education. These businesses are sources of job opportunities for many workers who may lack either the suitability or desire for production-type work. Greater emphasis on the enlargement of the scope of training programs in North Carolina should enhance the chances of finding jobs for many unemployed workers.

Training programs geared specifically to the problem of reducing unemployment continue to be planned and carried out under such Federal legislation as the Manpower Development and Training Act, the Area Redevelopment Act, and the Vocational Education Act. The use of this Study as a guide in determining worker requirements in selected nonmanufacturing industries, will point up needs for additional training programs in various areas of the State, and will help identify shortage occupations for which training would be feasible. This Study was limited in scope, however, and it does not attempt to provide a full measure of all occupational training needs in all nonmanufacturing industries. In addition to an analysis of present and future employment situations, continued constructive action must be taken by those whose responsibility it is to train and utilize manpower.

The North Carolina Employment Security Commission recognizes its established basic responsibilities of job placement and worker recruitment. In recent years, with the passage of ARA and MDTA, these obligations have been deepened to reach into the area of efficient planning for job training programs that can best serve both workers and employers. The Economic Opportunity Act of 1964, if enacted, places still greater responsibility on the Commission to take the lead in planning comprehensive programs, which will put more and more people to work, following basic education programs as well as job training. Through the study of various types of occupations in diverse industries, careful planning can result in vocational training courses which will benefit workers, and at the same time bring about more efficient utilization of manpower.

The State should continue to exercise diligent efforts to promote and support expansion of programs which provide vocational training facilities, and emphasize vocational guidance programs. Training programs must be up-dated whenever necessary to keep pace with changing occupational requirements, and individual employers should have an important part in planning special occupational training. Private industry should be encouraged to help conceive plans for the retraining of those employees whose jobs will be eliminated through automation or improved technology.

An important responsibility for reaching manpower goals rests upon the local community where specific employment problems are recognized and necessary action is planned and carried out. A major goal for each community should be a plan to encourage each individual to take advantage of every opportunity to develop and use his capabilities to the fullest extent possible. It is in a community that comprehensive programs on a person-to-person

basis may be carried out, and it is through this method that more people can be motivated to plan for improving their life's work.

The imbalance between labor supply and demand threatens to become more pronounced in the future, unless remedial actions are accelerated. The prime middle-age segment of the population will comprise a diminishing portion of the work force, with increasing numbers of both older and younger workers.

In order to approach the goal of full employment, the individual must be informed about the increasing demand for trained and educated workers so that he will be concerned with acquiring proper and sufficient training. Equally as important, community groups and government planners must continue to examine all possible sources of work for which training would provide suitable employment for many jobseekers. Fields of work which may supply jobs, both now and in the future, are presented within the scope of this survey. Constructive action continues to be initiated; and, in many areas, training programs have been completed which resulted in job placements of unemployed people completing such training. The unemployment problem, however, has by no means been solved. Further study, planning, and cooperative action by all concerned will be necessary to achieve the desired employment goals.

The new State Legislative Building at Raleigh, North Carolina

PART I

NORTH CAROLINA

An Economic Profile

- State's Population ..... 5.5 million by 1980
- Rural Population ..... shifting
- Work Force ..... around 2 million
- Employment ..... averaged more than 1.8 million in 1963
- Nonmanufacturing Employment ..... accelerated growth
- Female Employment ..... increasing
- Unemployment ..... one out of 25 in 1963
- Laboring Jobs ..... diminishing
- Trained Workers ..... strong demand

NORTH CAROLINA—AN ECONOMIC PROFILE

A more meaningful interpretation of survey findings may result after a brief look at North Carolina, its population, employment and industrial composition.

The industries included in this survey are primarily engaged in trade, service and financial activities. The growth rate of these industries is influenced by population distribution in the State and is also partially dependent upon the predominant type of employment in various areas.

Population

- In 1960, the total population of North Carolina stood at 4.5 million people.

- It has been estimated that the State's population will increase to 5.0 million individuals by 1970 and to 5.5 million by 1980.[1]

- Although predominantly rural, the population of North Carolina has followed the national trend toward urbanization. In 1950, about one-third of all residents lived in urban areas, but by 1960, the proportion had risen to almost 40 per cent of the State's total population. Nevertheless, the proportion of urban population in North Carolina is substantially lower than that for the United States as a whole, which had a 70 per cent urban population in 1960.

[1] North Carolina Department of Conservation and Development, Division of Community Planning

Labor Force

- By 1960, according to U. S. Census data, the total civilian labor force had increased to 1,680,442 in North Carolina, an 11 per cent gain over 1950.

- Despite the rising number of individuals in the work force, the increase in North Carolina has not kept pace with the Nation's growth. During the 1950-1960 period the Nation experienced a 15.4 per cent gain. The outmigration of farm workers from North Carolina has largely accounted for the disparity in growth rates.

- The total civilian labor force included more than 375,000 nonwhite workers in 1960, which represented 22 per cent of the total. The decline in this portion of the work force is shown by the fact that in 1950, a total of almost 387,000 nonwhite workers comprised more than one-fourth of the total civilian labor force in North Carolina.

- Women comprised 37.5 per cent of the labor force in 1960, and the number of females in the labor force has increased at a rate ten times greater than men during the 1950-1960 decade.

- Although rural population has shown declining trends, North Carolina has the largest farm population in the Nation and ranks second in the number of farms. The farm

labor force is also inflated each year by 10,000-12,000 migrant workers who enter the State for temporary work in farm jobs.

- In March, 1963, North Carolina's civilian labor force had risen to approximately 1.8 million workers. The large majority of workers were found in the Central Piedmont areas which experienced the lowest rate of unemployment in the State. The higher rate of joblessness in the Eastern and Western areas is partially due to fluctuations in seasonal job opportunities in those regions.

- North Carolina's labor force has continued to expand, reaching two million during the summer of 1963, with an average of 1.9 million workers for the year.

Employment and Trends in Unemployment

- According to census data, during the 1950-1960 period, total employment in North Carolina rose to 1.6 million workers, a gain of 9.8 per cent over 1950. This rate of increase, however, was not as great as the growth of the labor force.

- During 1963, an average of 1.8 million workers were employed in North Carolina, out of a total work force that had increased to approximately 1.9 million individuals. During the year an average of 44 workers out of every thousand were unemployed.

- Although North Carolina's rate of insured unemployment was consistently above that for the Nation from 1951-1957, it dropped below the national rate the following year; and from 1958-1962, continued to register a lower trend than that for the United States. These trends are illustrated below.

Chart A: Insured unemployment as per cent of insured employment, U. S. and N. C., years 1950-1962

- More than 1.7 million workers were employed in North Carolina in December, 1963. The unemployment rate had moved seasonally upward to 4.3 per cent of the labor force. Nevertheless, the proportion of jobless workers was lower than during the same month in 1960-1962.

- Employment in farm activities has declined sharply in North Carolina, as mechanization has replaced unskilled labor in many areas. In 1950, approximately 25 per cent of all workers were employed in farm jobs, but by 1960 only about 13 per cent of all workers were employed in agriculture.

- An average of 953,873 workers were covered by the North Carolina Employment Security Law during 1962. The following table shows distribution of insured employment by selected broad industry group for years 1950 and 1962.

DISTRIBUTION OF INSURED EMPLOYMENT—1950 AND 1962

	Per Cent 1962	Per Cent 1950
All Industries	100.0	100.0
Total Manufacturing	55.5	61.0
Total Nonmanufacturing	44.5	39.0
Trade, Whsle. and Retail	21.4	19.1
Fin., Ins., and R. Est.	4.2	2.5
Service	5.9	5.3
All Other	13.0	12.1

- An increasing proportion of workers covered by the North Carolina Employment Security Law are working in nonmanufacturing jobs.

- Rising family incomes have contributed to this uptrend, as service and sales activities increase with higher living standards.

- The proportion of workers in nonmanufacturing jobs in North Carolina is substantially lower than in the United States as a whole. In 1960, nonmanufacturing jobs comprised more than 60 per cent of the Nation's insured employment, compared with about 44 per cent in North Carolina. The lower rate in North Carolina is in line with the State's smaller family income compared with that for the Nation. In 1959, according to 1960 Census data, median family income in North Carolina was $3,956, significantly below median family income of $5,660 for the Nation.

- Occupational trends in North Carolina have shown a shifting pattern during the 1950-1960 period. Over the decade, the largest per cent increase in a single group occurred in clerical and kindred occupations. By 1960, the number of employed persons in this occupational group had increased 54.5 per cent over 1950. Workers in sales and service (excluding private household) also registered substantial gains over 1950.

- In 1960 the number of workers employed as laborers in nonfarm occupations had declined 4.4 per cent from 1950. Farm managers, foremen and laborers registered a significant 44.4 per cent drop. These decreases are in line with the current demand for trained workers as automation and mechanization continue to reduce the need for unskilled labor.

INTRODUCTION TO SURVEY FINDINGS

Economic trends of the recent past indicate increased growth for North Carolina; growth in population, in production, and in the consumption of goods and services. The increasing importance of nonmanufacturing industries is evident. This stimulated economy promotes a rising standard of living, with more people availing themselves of more services. The following presentation of survey findings attempts to point up the role that a significant portion of the North Carolina nonmanufacturing complex may play in future manpower utilization.

The Employment Security Commission engaged in this Study to develop additional factual data on present and future job opportunities in North Carolina—job opportunities which may provide work for the many youth entering the labor market and for unemployed persons seeking new jobs. It is hoped that the following immediate objectives set forth for this survey have been accomplished, at least in part:

- To determine a current estimate of the number of workers employed in the industries and occupations selected.
- To obtain a measure of future labor requirements for business expansion in the industries and occupations within the scope of the Study.
- To obtain estimates of future replacement needs by occupation—from death, retirement, promotion, and other withdrawals from the labor force.
- To ascertain the number of persons expected to be trained on-the-job for each of the 54 occupations studied, and to obtain employers' reaction to institutional training for these occupations.
- To determine the number of workers needed, in addition to those trained on-the-job, by late 1964 and by late 1966.

These survey findings provide a basis for the evaluation of training needs. If they help to make possible the development of additional vocational programs which will benefit both employers and jobseekers in North Carolina, the objective of the Employment Security Commission for this Study will be realized.

In addition to providing a foundation for planning vocational education programs, this report may serve as a useful guide for:

- Community groups in planning for manpower utilization, especially through the Manpower Development and Training Act, and the Area Redevelopment Act.
- Counseling youth in making informed career choices.
- Advising other unemployed persons in search of new job opportunities.
- Employers in planning to meet their own occupational training needs.
- Employment service personnel and others concerned with matching people and jobs more efficiently.

All nonmanufacturing industries and all occupations found in these industries could not be included in the survey. Although job needs studied represent only a portion of the needs in the State, it is believed that this report does provide a realistic measure of minimal job opportunities and worker requirements for 54 major occupations in 17 selected industry segments. Findings for this substantial cross-section of nonmanufacturing may well be representative of the growth which can be expected in all nonmanufacturing industries by late 1966.

Events may occur during the forecast periods which may affect the plans of employers. Forecasts have been made on the assumption that the economic and international situation will follow trends of the recent past through the fall of 1966. Forecasts have, of necessity, included only changes which could reasonably be planned or contemplated.

PART II

Employment Outlook, By Industry

- Surveyed Employment ..... up 16 per cent by 1966
- Growth Rate ..... faster than from 1960 to 1963
- Business Expansion ..... 21,000 new jobs in three years
  - — Trade 14,000
  - — Insurance 4,000
  - — Service and Finance 3,000
- Employment ..... major gains expected by:
  - — Automobile Dealers
  - — Credit Agencies and Banks
  - — Restaurants
  - — Insurance Companies
  - — Department Stores
- Outlook in Hiring ..... growing demand, short supply of trained workers

10/11

TABLE I: INDUSTRIAL SCOPE OF STUDY AND PER CENT COVERED BY SAMPLE—MARCH, 1963

Statewide Totals—March, 1963		Standard Industrial Classification		Statewide Sample Coverage—March, 1963

[2] Definitions of these industries found in Appendix A.

EMPLOYMENT SECURITY COMMISSION OF NORTH CAROLINA

INDUSTRIAL SCOPE OF SURVEY

Survey findings presented in this report do not represent estimates of total manpower requirements in the State for the occupations surveyed because not all industries could be included in the coverage. Survey findings apply only to the selected industries listed in Table I. Projected occupational needs are based on employment demands of employers active in the fall of 1963, and do not measure growth which will result from new firms being established in the State during the next three years.

Time and cost were factors which made it necessary to limit the industry coverage to a cross-section of nonmanufacturing and to use the mail-type survey approach. A discussion of this approach, along with information with respect to sample-firm selection, data collection and processing are included in the section on methodology found in the Appendix.

Table I shows a comparison of total employment and sampled employment. Actual employment in the 1,442 responding firms accounted for about 39 per cent of the total employment in surveyed industries in March of 1963. The data collected from the 1,442 responding firms were inflated to represent 8,476 establishments, employing more than 125,000 people in March of 1963.

The March, 1963 data, from which the survey sample was selected, were adjusted to September, 1963. Subsequent data in this Study show employment as of September, 1963, and is termed the survey period employment.

FIGURE 1: DISTRIBUTION OF SURVEY COVERAGE BY BROAD INDUSTRY GROUP[1]

Fall 1963 Employment: 132,191 = 100%

Figure 1 shows the distribution of employment in all surveyed groups in September, 1963.

A total of 132,191 workers were employed, with the largest percentage in the trade category. Workers in the service group comprised the smallest proportion of surveyed employment.

[1] Definitions of these groups are found in Appendix A.

SEASONALITY OF EMPLOYMENT IN SURVEYED INDUSTRIES

The accompanying charts depict the varying range of seasonal influence on employment in each surveyed industry group, from January 1962-September 1963. The actual employment for each month of the period is shown as a deviation from an average of employment over the 21-month period. The growth rate was also plotted to show the employment trend for each industry group, as unaffected by seasonal variations.

Employment growth in the insurance and finance industries shows little dependence on seasonal influences. As seen in Charts B and C, actual employment increases and declines in these industries closely parallel the indicated trends.

[1] Average based on period from January, 1962 through September, 1963.

SEASONALITY OF EMPLOYMENT IN SURVEYED INDUSTRIES

In the trade and service industries employment follows distinct seasonal patterns.

Employment in the surveyed service industries, heavily dependent on tourist business in the eastern and western sections of the State, rises to a seasonally high point during the summer months, and drops substantially below peak levels in the winter. This trend is heavily affected by hiring for the hotel, motel and tourist court industries in the resort areas. Chart D indicates the sharp seasonal increases and declines in employment in the surveyed service categories, compared with the normal growth rate.

As seen in Chart E, seasonal deviations also occur in the trade industries. The peak employment period is reversed, however, from the summertime high of the service businesses. Wholesale and retail trade activities climb to a seasonal peak in December, followed by steep declines during January and February.

[1] Average based on period from January, 1962 through September, 1963.

TABLE II: INSURED EMPLOYMENT GROWTH TRENDS IN SURVEYED INDUSTRIES

Surveyed Industry	Average Monthly Insured Employment 1960	Average Monthly Insured Employment 1961	September Employment 1963	Per Cent[1] Change 1960-1963	Level of Employment Fall of 1964	Level of Employment Fall of 1966	Per Cent[2] Change 1963-1966

[1] Includes new firms established during the period.

[2] Includes only establishments active during the fall of 1963.

EMPLOYMENT TRENDS IN SURVEYED INDUSTRIES

Projections to late 1966 indicate that about 16 per cent more workers will be on the payrolls of the 8,476 firms within the scope of the Study than were employed in the fall of 1963.

The nonmanufacturing industry categories studied collectively employed more than 132,000 workers during late 1963. More than 84,000 of these workers were engaged in trade industries. Trade industries are expected to require the highest number of additional workers by the end of the 1966 forecast period. If trade employers' expectations are realized, almost 14,000 additional workers will be needed for expansion alone.

Chart F shows anticipated employment growth rates in surveyed broad industry groups, from late 1963 to late 1966.

Table II compares the rates of employment expansion in surveyed industries for the three-year period to 1963, and the projected three-year period to 1966. The growth rate for the earlier period was somewhat stymied by the 1961 recession, which saw seven surveyed industry segments slump to employment levels below 1960 averages. All industries recovered sharply in 1962 and 1963, and by late 1963 had gained an additional 16,000 workers, registering a significant 14 per cent increase for the three-year period. Employment growth rate during this period was led by credit agencies and banking, which showed decisive gains of 31 and 26 per cent, respectively. A slowing trend is indicated for these two industries from 1963 to 1966, as less marked employment gains of 17 and nine per cent are indicated. Employment in credit agencies, however, will continue to grow at a faster rate than the anticipated 16 per cent Statewide overall employment gain in surveyed industries by the fall of 1966.

Automobile dealers and gasoline service stations, which were hard-hit by the 1961 recession when employment decreased by more than 800 persons from 1960 and showed only a meager three per cent gain to 1963, are expected to forge ahead by late 1966, with a pointed 21 per cent increase, which is in line with automobile manufacturers' apparent optimism.

Electrical repair shops are expected to utilize an additional 130 workers by 1966, which is a noticeable 42 per cent increase over 1963. Household appliance stores, which did not fully recover from 1961, and which showed a six per cent decrease in employment from 1960 to 1963, are expected to grow employment-wise by more than 12 per cent by the end of 1966.

Even though employment in security brokerage firms declined from 1962 to 1963, an increase of more than 20 per cent is expected by late 1966.

TABLE III: BROAD INDUSTRY EMPLOYMENT BY MAJOR OCCUPATIONAL GROUP, FALL 1963

Broad Industry Group	Total Employment	Employment In		Clerical Occupations	Sales Occupations	Service Occupations	Skilled Occupations	Semiskilled Occupations
		Nonsurveyed [1] Occupations	Surveyed Occupations					
All Industries Surveyed	132,191	35,269	96,922	27,230	31,382	21,515	12,449	4,346
Trade	84,412	19,119	65,293	9,352	24,883	16,429	10,474	4,155
Finance	20,105	8,206	11,899	10,449	374	1,076	0	0
Insurance	16,429	4,336	12,093	6,021	5,799	250	23	0
Service	11,245	3,608	7,637	1,408	326	3,760	1,952	191

EMPLOYMENT DISTRIBUTION

In September 1963, employment in surveyed industries totaled 132,191 workers. Surveyed occupations comprised 73 per cent of all employment in the industries studied, with occupational coverage ranging from a high of 77 per cent in the trade industries, to a low of 59 per cent in the finance category.

Table III shows the broad industry distribution at survey time of all surveyed employment, surveyed occupational employment by major occupational group, and nonsurveyed employment. The trade industries, comprising almost two-thirds of all surveyed employment, used workers in all occupational categories. Workers in sales and service occupations, however, predominated in this group. The trade industries also employed large numbers of clerical workers such as bookkeepers, cashiers, clerk-typists and stock clerks, along with many skilled workers in such varied occupations as automobile mechanics and seamstresses.

More than eight out of ten workers in finance businesses were engaged in clerical occupations. These jobs included bank tellers, bookkeeping machine operators, secretaries, cashiers, and clerk-typists. The only sales job represented in finance was that of securities salesman.

In the insurance industry, jobs were almost equally divided between clerical workers and insurance salesmen. More than half of the clerical workers were employed as secretary-stenographers and general clerk-typists.

Workers in the service category showed a wider variety of occupations than those in finance and insurance, with the heaviest proportions in service and skilled jobs.

[1] Professional and managerial occupations, and unskilled occupations were not surveyed.

TABLE IV: EMPLOYMENT BY BROAD INDUSTRY GROUP IN SURVEYED OCCUPATIONS IN FALL 1963, AND JOB OPPORTUNITIES BY 1966

Industry	Employment During Fall of 1963	Anticipated Employment By Fall of 1966		Worker Demand By Fall of 1966			Worker Supply By Fall of 1966	Net Additional Requirements By Fall of 1966
		Employment	Per Cent Increase	Expansion	Replacement	Total New Job Opportunities	From On-The-Job Training	
All Surveyed Industries	96,922	114,293	17.9	17,371	10,538	27,909	10,239	17,670
Trade	65,293	76,693	17.5	11,400	6,009	17,409	4,357	13,052
Finance	11,899	13,987	17.5	2,088	1,796	3,884	2,360	1,524
Insurance	12,093	14,978	23.9	2,885	1,635	4,520	2,990	1,530
Service	7,637	8,635	13.1	998	1,098	2,096	532	1,564

Almost 28,000 new workers will be required in all surveyed industries by late 1966. Approximately 38 per cent of the total will be needed for replacement, and about 37 per cent of all new workers will be trained by employers. This close parallel indicates that employer training will supply only replacement needs in most surveyed business categories.

A variation from this trend is seen in the insurance industry. In this category, replacement need is low—about 1,600 out of 4,500 new jobs—and company training is comparatively high. More than two-thirds of all new workers will receive on-the-job training. This high proportion is partially due to the fact that many employers in this business prefer to train employees according to individual company methods.

The greatest proportion of replacement, 52.4 per cent of all new jobs, will be required in the service industries. The trade industries will experience the lowest replacement rate over the three-year survey period and will provide on-the-job training for the smallest proportion of new workers. The large volume of more than 13,000 workers needed by 1966, over and above those who will receive company training, far outweighs worker requirements for all other surveyed business categories.

FIGURE 2: INDUSTRY EMPLOYMENT OF WOMEN

Figure 2 shows the proportion of women, in all surveyed occupations, employed in each industry category. The high proportion of female employment in the finance business raises the overall employment of women to more than half of all surveyed occupational employment. More than eight out of ten workers in this category, employing large numbers of clerical workers, are women. In each of the other groups, however, jobs are almost equally divided between men and women.

Part III

Employment Outlook, By Occupation

- Expansion in Studied Occupations .... up 17,400 by late 1966
- Growth in Major Groups ..... skilled jobs up 28 per cent
  ..... sales jobs up 18 per cent
- Net Additional Workers Needed ..... by 1966
  - — Sales 5,000
  - — Service 4,000
  - — Skilled 3,900
  - — Clerical 3,900
  - — Semiskilled 800
- Growth in Selected Occupations ..... by 1966
  Largest Numerical Increases Expected for:
  - — Automobile Mechanic
  - — Insurance Salesman
  - — Waitress
  - — General Salesman
  - — General Clerk-Typist
- Replacement Needs ..... 10,500 by 1966
- Women Workers ..... predominant in clerical and service occupations
- Institutional Training Needed? .... more than 63 per cent of employers say, "yes"

TABLE V: EMPLOYMENT IN 54 SELECTED OCCUPATIONS BY BROAD INDUSTRY GROUP

FALL OF 1963

Occupation	All Surveyed Industries	Industry Distribution

EMPLOYMENT SECURITY COMMISSION OF NORTH CAROLINA

DISTRIBUTION OF SURVEYED EMPLOYMENT

Table V on the two preceding pages indicates broad industry employment at survey time. At that time 67 per cent of employment in all surveyed occupations was found in the trade group, compared to 7.8 per cent in service.

Clerical jobs were most prevalent in the finance business, but large numbers of clerical workers were also employed in the insurance and trade categories.

More than 4,100 general clerk-typists were employed in establishments in the survey scope during late 1963. Insurance companies employed 54 per cent of these.

Employment in the sales occupations studied was centered in trade and insurance. These two groups combined, employed 97 per cent of the surveyed sales employment in late 1963.

More than 14,000 salespersons and sales clerks, all in the trade industry, were included in the survey.

More than three-fourths of all service workers were employed in the trade category while about 17 per cent were working in jobs in the service industries. Janitor-porter and maid were the only service occupations in the finance and insurance businesses. More than 9,450 waitresses and waiters were included in the scope of the Study. Ninety per cent of these were found in trade. Eighty-four per cent of the skilled workers surveyed were employed in the trade industries, while 15.7 per cent were in service industry jobs.

Of the 5,600 automobile mechanics surveyed, nearly 90 per cent were employed in trade.

Surveyed semiskilled workers again were found predominantly in the trade industries which employed 95 per cent of all semiskilled workers.

The nearly 3,000 automobile service station attendants in surveyed establishments were employed in trade.

The accompanying chart shows the employment distribution in all surveyed establishments by major occupational group.

Clerical and sales workers made up more than 44 per cent of the employment in all industries surveyed in late 1963, while semiskilled workers comprised slightly more than three per cent of the workers within the scope of the study.

CHART G: DISTRIBUTION OF SURVEYED EMPLOYMENT
FALL 1963[1]

[1] Definitions of Occupational Groups are found in Appendix A.

EMPLOYMENT GROWTH

The accompanying charts H and I show anticipated employment growth for major occupational groups and selected occupations during the 1963-1966 period. Growth rates for all occupations are shown in Table VI.

Employment in all occupations will increase a substantial 18 per cent over the next three years. Skilled occupations, as shown in Chart H, have the fastest anticipated growth rate and will offer nearly 3,500 new jobs because of expansion by the fall of 1966. More than half of these new jobs will be for automobile-truck mechanics, as employers anticipate a strong demand for this type of worker, due to business expansion. Although sales jobs will not increase as rapidly, percentage-wise, the largest numerical increase by the fall of 1966 occurs in this occupational category. The bulk of the 5,600 new jobs for expansion in this group will be for insurance and general salesmen, along with sales clerks and sales persons. Semiskilled jobs are expected to increase more slowly than all others although a definite trend is difficult to establish, since only three occupations were studied in this category.

CHART H: EMPLOYMENT GROWTH IN MAJOR OCCUPATIONAL GROUPS: 1963-1966

Also, the growth rate in one semiskilled job is atypical: e.g., the number of workers employed as diesel mechanic helpers is expected to be more than four times greater in 1966 than in 1963, but total volume is expected to increase by only 54 workers.

Service occupations will grow at a rate of more than 15 per cent during the three-year period and will require almost 3,300 workers for expansion. More than half of these workers, 1,676, will be employed as waitresses and waiters. By late 1966, employment of short order cooks is expected to be one-fourth greater than during the fall of 1963.

A total of more than 4,300 additional workers will be required for expansion in the clerical occupations by late 1966, a growth rate of 16 per cent. Key-punch operators are expected to have the greatest rate of gain in employment, increasing by nearly 50 per cent over 1963, but the largest numerical increase is anticipated for general clerk-typists, with a demand for 882 workers by the fall of 1966.

CHART J: THREE-YEAR EXPANSION AND REPLACEMENT NEEDS, BY MAJOR OCCUPATIONAL GROUP

1963 TO 1966

The major source of job openings in surveyed occupations by the fall of 1966 will result from growth in expanding industries. The other source of job openings, often overlooked, but fully as important, will result from deaths, retirements, or other withdrawals from the labor force, excluding job shifting. Chart J compares projected expansion and replacement needs in major occupational groups by 1966.

Job opportunities resulting from expansion are expected to make up about 62 per cent of all additional workers who will be needed by 1966, in surveyed occupations.

Replacement needs for the clerical and service occupational groups, which are 75 per cent female, are expected to make up an impressive 43 per cent of the total job opportunities forecast for these two groups by 1966. By contrast, replacement needs for the skilled and sales occupational groups, which are 70 per cent male workers, will make up only 31 per cent of the total job openings in these groups by the 1966 forecast date.

EMPLOYMENT NEEDS IN SURVEYED OCCUPATIONS

By the fall of 1966, almost 28,000 new job opportunities will be available in the selected occupations. Expansion will account for 17,370 new jobs, resulting in an 18 per cent increase in employment over the fall of 1963. Replacement needs will compromise about 38 per cent of worker demand during the next three-year period, with high attrition rates in service and clerical jobs. These two occupational categories have the highest proportion of female workers. Although employers expect to train more than 10,000 workers by 1966, this training will fulfill replacement needs, for the most part. More than 63 per cent of surveyed employers think institutional training would be helpful to them in meeting employment needs.[1]

Table VI shows anticipated job opportunities and net worker requirements by the fall of 1966. The charts to the right show employment distribution of women workers in surveyed occupational groups. Charts K and L compare one-year and three-year net additional worker needs for major occupational groups, and for five selected occupations.

Clerical Occupations

Employment in the 16 selected clerical occupations totaled 27,230 workers, comprising about 28 per cent of all surveyed occupational employment in the fall of 1963. Business expansion is expected to add 4,350 workers in clerical jobs by late 1966, and an additional 3,270 workers will be needed for replacement.

Worker demands for clerk-typist, cashier, secretary-stenographer, bank teller, and bookkeeper are expected to comprise three-fourths of all clerical net additional needs, by late 1966. The need for 649 trained clerks and typists represents the heaviest future demand, since few businesses today can operate without the services of these basic clerical workers. Ninety-seven out of one hundred workers in this type of job are women, while about 84 per cent of all clerical workers studied are female. Bookkeeping machine operator is the only clerical occupation in which the supply of workers is expected to exceed the demand by the end of the three-year period. Technological development resulting in increased use of computer equipment is continually reducing the need for workers in this occupation.

Sales Occupations

The need for salesmen will out-strip all other occupational shortages by the fall of 1966. The largest number of new job opportunities in this category will stem from the insurance industry as more than 2,700 openings are expected for salesmen over the next three years. At survey time employers

[1] Employers' reaction to the need for institutional training for specific occupations is shown in Appendix B.
[2] The proportion of women in each surveyed occupation is found in Appendix B.

FIGURE 3: PROPORTION OF WOMEN IN MAJOR OCCUPATIONAL GROUPS[2] FALL, 1963

Continued

listed 417 current vacancies for this job. Although employers expect to train almost three-fourths of the new workers required during the next three years, a net requirement for 749 workers is anticipated by the fall of 1966. A low proportion of on-the-job training is expected for other sales jobs. Less than one-fifth of the 2,000 general salesmen needed by late 1966 will receive job training by employers, leaving a significant need for almost 1,700 workers.

In the sales group as a whole, which comprised one-third of all employment in surveyed occupations, almost two out of three workers were men. Nevertheless, in the salesperson and sales clerk category, three-fourths of the workers were women. About 60 per cent of the contacted employers favored institutional sales training.

FIGURE 3: PROPORTION OF WOMEN IN MAJOR OCCUPATIONAL GROUPS FALL, 1963

Service Occupations

Additional needs in service jobs run second only to those for sales occupations. The replacement rate, however, is much higher in service work. About 45 out of every 100 new service job opportunities will be for replacement purposes by the end of the three-year period.

More than six out of every ten workers in service jobs are women. In the waitress-waiter category eight out of ten employees are female, and this group of workers registered the greatest net additional needs in service work, with an occupational shortage of almost 1,800 workers by the fall of 1966. Replacement needs will account for about four out of every ten new job openings in this occupation and in some service occupations, replacement needs outweigh expansion needs. Employers listed vacancies for 343 waitress-waiter jobs at survey time, accounting for more than one-half of the 631 vacancies listed in service occupations. In late 1963, chefs, cooks and short-order cooks comprised more than one-fourth of surveyed occupational employment in service jobs. They will comprise almost 30 per cent of the net additional workers needed for all service occupations, by 1966. Fifty-one per cent of employers recommended training through Industrial Education Centers for service occupations. More than 60 per cent thought IEC training for cooks, hostesses, kitchen stewards and waitresses would be helpful.

Skilled Occupations

Employment in skilled jobs made up only 13 per cent of all occupational employment but is expected to experience the fastest growth rate, 28 per cent, over the three-year period.

Except for seamstresses and bakers, jobs in the surveyed skilled occupations were filled exclusively by men. The replacement need in the skilled category is the lowest of all occupational groups. Employers expect to train less than one-fifth of the workers needed to fill about 5,000 new jobs by 1966.

Continued

At survey time, employers listed 505 vacancies for automobile-truck mechanics and it is anticipated that workers in this occupation will continue to be in short supply, increasing to a net need for almost 2,200 workers by the fall of 1966. Only a small proportion of mechanics are expected to receive on-the-job training since many small businesses cannot afford the time and personnel necessary for formal job training programs. More than four out of five employers recommended vocational training for skilled occupations.

FIGURE 3: PROPORTION OF WOMEN IN MAJOR OCCUPATIONAL GROUPS FALL, 1963

Semiskilled Occupations

In semiskilled occupations studied, with 100 per cent male employment, a need for almost 800 trained workers is anticipated by 1966.

The demand for service station attendants will outweigh the available supply of trained workers, partially due to lack of advancement opportunities and long hours of work. Seventy-three per cent of the contacted employers expressed interest in institutional training for semiskilled jobs.

CHART K: NET WORKER REQUIREMENTS: 1964[1] AND 1966
COMPARISON OF MAJOR OCCUPATIONAL GROUPS

CHART L: NET WORKER REQUIREMENTS: 1964[1] AND 1966
COMPARISON OF SELECTED OCCUPATIONS

[1] Net worker needs, by occupation, by the fall of 1964 are found in Appendix B.

PART IV

Area Survey Findings

AREA 1
Manufacturing Employment Ranks High
- Ranks Third in Unemployment Rate
Leads all Areas in Need for Automobile Mechanics by 1966

AREA 2
Most Thickly Populated Area
- Highest Weekly Wage
Strong Demand for Sales Workers

AREA 3
Lowest Unemployment Rate
- Ranks Second in Average Weekly Wages
Tops all Areas in Net Additional Needs by 1966

AREA 4
Least Population
- Ranks Second in Net Worker Requirements
Clerical Worker Need Great

AREA 5
Fewest Covered Workers
- Lowest Weekly Wage
General Salesmen and Automobile Mechanics Needed

AREA 6
Largest Population and Land Area
- Highest Unemployment Rate
Salesmen Needed

AREAS DESIGNATED FOR DISTRIBUTION OF STATEWIDE SURVEY FINDINGS

LOCATIONS OF TRAINING INSTITUTIONS AND NORTH CAROLINA EMPLOYMENT SECURITY COMMISSION OFFICES

INTRODUCTION

Survey results were compiled for six designated areas of the State as shown on the above map. Area results were developed to identify the distribution of employment within specific regions of the State and to point-up local occupational needs.

Table VII on the following page, shows area distribution of employment by industry during the fall of 1963. The industrialized central areas of the State comprise the heaviest proportion of surveyed nonmanufacturing employment, especially in the retail trade, insurance and finance industries. The number of workers in the hotel, motel and tourist court business is slightly higher in the western part of the State than in other areas, largely because of the heavy volume of tourist and travel trade in that region.

Table VIII shows the anticipated growth rate in each selected industry by the end of 1966, along with the expected increase by area. Over the three-year period, all employment is expected to increase 16 per cent with significantly faster growth rates in the insurance, credit agency, automobile dealer and gasoline service station businesses.

A more detailed analysis of each area's industrial composition, labor force and occupational needs is presented in the succeeding section.

AREA 1

ECONOMIC AND GEOGRAPHIC PROFILE

		Area Rank
Land Area	10,609 Square Miles	2
1960 Population	925,143	2
Population per Square Mile	87	4
	MARCH, 1963	
Civilian Labor Force	361,440	1
Civilian Employment	338,390	1
Rate of Unemployment	6.4 Per Cent	3
Average Weekly Wage[1]—1962	$70.75	4

Area 1 extends over 26 counties and comprises about one-fifth of North Carolina's land area and population.

In March, 1963, the unemployment rate of 6.4 per cent for *Area 1* was substantially above the ratio of 5.8 per cent for all areas. Seasonal influences on the tourist business and declines in agricultural employment contribute to the comparatively high rate of unemployment, and are partially responsible for the existence of pockets of substantial and persistent unemployment in *Area 1*. Eleven counties were classified as "labor surplus" by the United States Department of Labor in January, 1964. Twenty-one counties in this area are located in the Nation's Appalachia Poverty Belt, for which a long range economic development program is currently being considered by Congress.

In *Area 1*, during the second quarter of 1963, more than two-thirds of the 225,000 workers covered by the North Carolina Employment Security Law were employed in manufacturing jobs, compared with 55 per cent of all covered workers throughout the State. This high proportion of manufacturing jobs in *Area 1* partially results from the large volume of insured employment in the textile and furniture industries concentrated in the eastern part of the area.

[1] Wages paid in jobs covered by the North Carolina Employment Security Law.

Area Findings

Less than one-sixth of the State's employment which was surveyed was found in *Area 1*. The State's heaviest concentration of employment in hotels, motels, and tourist courts, and auto dealers and service stations, was found in this area. A heavy volume of tourist business largely accounts for the high rate of employment in these industry groups in *Area 1*.

Employment in all surveyed establishments in *Area 1*, is expected to increase from 20,500 at survey time to 23,350 by the latter part of 1966, an increase of about 14 per cent. By the end of the three-year period, employment in the occupations studied is expected to increase 17 per cent, which will closely parallel the estimated 18 per cent rise for North Carolina. This anticipated expansion plus expected replacement needs results in net additional needs for about 2,750 workers by late 1966, in the occupations studied.

Skilled occupations show the greatest proportion of employment increase, 29 per cent, over the three-year forecast period. Expanding demands for automobile mechanics in *Area 1* account for much of this rise, which follows the expected over-all employment uptrend in the automobile dealer and service station industries.

[3] Growth plus replacement needs minus anticipated on-the-job training.

AREA 2

ECONOMIC AND GEOGRAPHIC PROFILE

		Area Rank
Land Area	4,400 Square Miles	6
1960 Population	671,671	5
Population per Square Mile	153	1
	MARCH, 1963	
Civilian Labor Force	297,440	4
Civilian Employment	283,150	3
Rate of Unemployment	4.8	5
Average Weekly Wage—1962[1]	$79.96	1

Area 2, which is composed of only nine counties, is the most densely populated section of North Carolina. The population is heavily concentrated in the Greensboro-High Point-Winston-Salem "industrial triangle," located in the southeastern section of the area.

During March of 1963, the unemployment rate in *Area 2* was 4.8 per cent of the labor force, lower than four other areas in the State. Within the area, however, the proportion of unemployment showed wide variations. Seven counties in *Area 2* are included in the country's Appalachia Poverty Belt, recently recognized by Congress as having the most serious unemployment problem in the Nation.

During the second quarter of 1963, an average of almost 198,000 workers in this area were employed in jobs covered by the North Carolina Employment Security Law. More than 41 per cent of employment was in nonmanufacturing businesses, with employment in trade predominating. About 115,800 workers were employed in manufacturing industries, with a heavy concentration of almost 85,000 workers in Forsyth and Guilford counties.

[1] Wages paid in jobs covered by the North Carolina Employment Security Law.

Area Findings

Approximately one-fifth of the State's surveyed employment was in *Area 2.* More than 30 per cent of surveyed employment in insurance firms was in this section of the State. This large proportion is accounted for by the location in this area of the home offices of the largest insurance companies in North Carolina. In *Area 2,* employment in clothing stores was greater than it was in any one of the other defined areas of the State. Three major cities located in this section contributed to the large volume of employment in retail clothing stores.

By the fall of 1966, employment in all surveyed establishments in *Area 2* is expected to increase from about 26,400 to almost 31,700 workers. These additional workers would represent a 20 per cent gain above employment which existed during the fall of 1963, and would result in a substantially faster growth rate than the 16.2 per cent gain anticipated for the State as a whole.

Employment growth in the studied occupations will also rise about one-fifth during the three-year period. Although skilled occupations are expected to show the fastest growth rate—26.6 per cent—over the three-year yeriod, the greatest net number of workers will be required for sales occupations.

AREA 3

ECONOMIC AND GEOGRAPHIC PROFILE

		Area Rank
Land Area	5,093 Square Miles	5
1960 Population	709,696	3
Population per Square Mile	139	2
	MARCH, 1963	
Civilian Labor Force	305,570	2
Civilian Employment	293,270	2
Rate of Unemployment	4.0 Per Cent	6
Average Weekly Wage[1]—1962	$77.81	2

Ten counties are included in *Area 3*, and although it is relatively small in land area, it includes heavily populated Mecklenburg County. The metropolitan city of Charlotte, the largest in North Carolina, is located in this county. This partially accounts for the density of population per square mile in *Area 3*.

In March of 1963, *Area 3* registered the lowest unemployment rate in North Carolina. The area, as a whole, is highly urbanized, so that business activities are relatively independent of seasonal influences. Unemployment rates for the various counties in this area were lower, for the most part, than the rate of unemployment for all areas in the State.

In *Area 3* during the second quarter of 1963, more than 211,000 workers were employed in jobs covered by the North Carolina Employment Security Law. Although the majority were working in manufacturing jobs, almost 48 per cent of the insured workers were engaged in nonmanufacturing activities. Approximately 45,000 workers were employed in the wholesale and retail trade industries, of whom 31,340 were in Mecklenburg County. Large numbers of workers were also employed in the finance, insurance and real estate businesses.

[1] Wages paid in jobs covered by the North Carolina Employment Security Law.

Area Findings

Area 3 had almost 22 per cent of surveyed employment, the largest proportion in the State. Workers in this section outnumbered those in other areas of North Carolina in ten out of 17 industries included in the study.

By the fall of 1966, it is anticipated that surveyed employment in *Area 3* will increase from almost 29,000 to about 35,000 workers. Eating and drinking places will experience the most rapid growth rate, with an expected employment rise of 37 per cent over the three-year forecast period.

Employment in the studied occupations is expected to increase at a slightly slower pace than all surveyed employment in *Area 3*, registering a gain of 19 per cent by late 1966. Of the 4,200 workers needed for business expansion over the next three years, the greatest number will be required in the service occupations studied. By the fall of 1966, it is estimated that an additional 700 waitresses and waiters will be needed for business expansion, showing a growth rate that parallels the expected over-all employment gain in eating and drinking places in this area.

The greatest expansion and replacement needs in this area will be for workers in clerical occupations. By the fall of 1966, an additional 200 workers each will be required as secretaries, cashiers, and general clerk typists.

[3] Growth plus replacement needs minus anticipated on-the-job training.

AREA 4

ECONOMIC AND GEOGRAPHIC PROFILE

		Area Rank
Land Area	5,265 Square Miles	4
1960 Population	596,331	6
Population per Square Mile	113	3
	MARCH, 1963	
Civilian Labor Force	242,470	5
Civilian Employment	229,745	5
Rate of Unemployment	5.2 Per Cent	4
Average Weekly Wage[1]—1962	$74.60	3

Area 4, although small in land area, ranks third in density of population. The two counties of Durham and Wake, in which the large city of Durham and the State Capital at Raleigh are located, include almost half of the population in this 11-county area.

In March of 1963, unemployment in *Area 4* comprised 5.2 per cent of the civilian labor force. This proportion was lower than the rate in three other areas in the State. Nevertheless, in January, 1964, two counties in *Area 4* were classified by the United States Department of Labor as areas of "substantial and persistent unemployment," and designated as "redevelopment areas" under the Area Redevelopment Act.

During the second quarter of 1963, approximately 118,300 workers were employed in jobs covered by the North Carolina Employment Security Law. More than half of these workers were engaged in nonmanufacturing jobs. In Wake County more than three-fourths of all insured workers were employed in nonmanufacturing businesses. The greatest numbers of workers in manufacturing jobs were employed in Alamance and Durham counties.

Area Findings

Seventeen per cent of surveyed employment occurred in *Area 4*, but a considerably larger proportion of the Statewide employment included in this study was found in men's and boys' clothing stores, security brokers, and insurance carriers and agencies. More than 31 per cent of all insurance agents in the State were employed in *Area 4*.

By the fall of 1966, surveyed employment in *Area 4* is expected to increase 15 per cent, from 22,500 to 25,900 workers. Women's ready-to-wear shops will experience the fastest growth rate, and it is anticipated that surveyed employment in this business will increase one-third over the three-year period, from 772 workers in the fall of 1963, to more than 1,000 workers by late 1966.

Employment in the 54 surveyed occupations is expected to rise 18 per cent by late 1966, increasing from about 16,000 to 19,000 workers. In addition to this anticipated expansion, a need for more than 1,600 workers for replacement will offer further job opportunities to individuals seeking work.

Sales occupations will require the greatest number of workers because of expansion in business by 1966, but the greatest net need for additional workers will be in clerical occupations.

AREA 5

ECONOMIC AND GEOGRAPHIC PROFILE

		Area Rank
Land Area	8,360 Square Miles	3
1960 Population	691,950	4
Population per Square Mile	83	5
	MARCH, 1963	
Civilian Labor Force	218,240	6
Civilian Employment	203,860	6
Rate of Unemployment	6.6 Per Cent	2
Average Weekly Wage[1]—1962	$62.21	6

Most of the 13 counties in *Area 5* are sparsely populated. Although there are no metropolitan cities located here, two large military installations provide a more urbanized population in two counties. One of these counties, Cumberland, has almost 148,500 residents, or about one-fifth of the area's entire population.

In *Area 5* during 1962, lower average weekly wages were paid to workers covered by the North Carolina Employment Security Law than were paid in any other area of the State. Industrial development in this southeastern section has not been as rapid as in the central areas of North Carolina.

During March of 1963, unemployment of 6.6 per cent of the labor force was the second highest of the State's six areas. Seasonal factors in this primarily rural region contributed to the comparatively high rate of joblessness.

Workers in jobs covered by the North Carolina Employment Security Law totaled about 85,900 individuals during the second quarter of 1963, the smallest number of insured workers in the six areas of the State. About half of these individuals were employed in nonmanufacturing jobs, with approximately 34,000 workers engaged in such activities as trade, service, finance, insurance, and real estate. In Cumberland County alone, almost 11,000 individuals were employed in these activities. The distribution of manufacturing employment was relatively even in the thirteen counties, with the greatest proportion in Lee County.

Area Findings

Area 5 had ten per cent of all surveyed employment. The largest numbers of workers were employed by automobile dealers and in service stations, eating and drinking places, department stores, and banks.

By the fall of 1966, surveyed employment in *Area 5* is expected to increase from 13,550 to approximately 15,000 workers, an increase of about ten per cent. This is the slowest growth rate anticipated for any area in the State. Nevertheless, employment in seven of the 17 industries included in this study will increase at a substantially faster pace than the over-all employment rise in this area.

In this area, it is anticipated that employment in surveyed occupations will increase by about 14 per cent over the three-year forecast period. Business expansion will account for more than 300 new jobs in each of such categories as clerical, sales and skilled occupations. The greatest net expansion and replacement needs will be for sales and skilled workers, with requirements for 200 general salesmen and 200 automobile-truck mechanics by the fall of 1966.

AREA 6

ECONOMIC AND GEOGRAPHIC PROFILE

		Area Rank
Land Area	15,340 Square Miles	1
1960 Population	961,364	1
Population Per Square Mile	63	6
	MARCH, 1963	
Civilian Labor Force	304,690	3
Civilian Employment	281,380	4
Rate of Unemployment	7.7 Per Cent	1
Average Weekly Wage[1]—1962	$65.65	5

Area 6 is primarily a rural, agricultural sector and covers the easternmost part of North Carolina. As defined for this Study, it is the biggest geographical area in the State; it comprises 31 counties; and it has a greater portion of the State's population than any other area. The number of people per square mile, however, is the fewest of all areas.

During March of 1963, unemployment of 7.7 per cent of the labor force in *Area 6* was the highest among the defined areas of the State. This high rate results primarily from the seasonal nature of agriculture, fishing activities along the coastal areas, and tourist businesses during the summer months—all of which employ great numbers of workers.

During the second quarter of 1963, about 114,400 people in *Area 6* were working in jobs covered by the North Carolina Employment Security Law. Almost 55 per cent were employed in nonmanufacturing activities, and more than 33,500 individuals were working in wholesale and retail trade jobs. Manufacturing employment was spread throughout the area with the greatest concentration of about 6,500 workers in New Hanover County, wherein the port city of Wilmington is located.

[1] Wages paid in jobs covered by the North Carolina Employment Security Law.

Area Findings

About 15 per cent of the State's employment surveyed in this Study was in *Area 6*. By the fall of 1966, employment in the studied industries is expected to increase from 20,195 to 22,735 workers, a gain of 12.6 per cent. The most significant growth rate is expected in insurance firms, where forecasts indicate that employment may increase by nearly 41 per cent over the three-year survey period.

Employment in the occupations studied is expected to increase more than 16 per cent in *Area 6* by the fall of 1966, which would be a more substantial growth rate than that anticipated for total employment.

Sales occupations will require the greatest number of additional workers by the end of the forecast period. Job opportunities will be more numerous for trained automobile and truck mechanics by the fall of 1966, than for any of the 17 skilled occupations which were surveyed.

APPENDIX A

Definitions

INDUSTRY GROUPS[1]

Shown below is a brief description of each of the 17 surveyed nonmanufacturing industries, and industry segments.

Motor Vehicles and Automobile Equipment
Wholesale establishments primarily engaged in the distribution of new and used automobiles, automotive parts and accessories, service station and garage equipment, and tires and tubes for motor vehicles.

Department Stores
Retail stores carrying a general line of apparel, home furnishings, and housewares, normally arranged in separate sections. Establishments included in this industry generally employ 25 or more persons.

Automobile Dealers and Gasoline Service Stations
This major group includes retail dealers selling new and used automobiles and trucks, and new parts and accessories. Includes gasoline service stations.

Men's and Boys' Clothing and Furnishings
Establishments primarily engaged in the retail sales of men's and boys' suits, shirts, and other furnishings.

Women's Ready-to-Wear Stores
Establishments primarily engaged in the retail sale of women's coats, suits, and dresses.

Family Clothing Stores
Establishments primarily engaged in the retail sale of clothing, furnishings, and accessories for men, women, and children, without specializing in any one line.

Household Appliance Stores
Establishments primarily engaged in the retail sale of electric and gas refrigerators, stoves, and other household appliances. May sell radio and TV sets.

Radio, Television, and Music Stores
Establishments primarily engaged in the retail sale of radios, television sets, and record players. May sell household appliances and musical instruments.

[1] Based on "Standard Industrial Classification Manual." Broad Industry groupings are shown on page 12.

Eating and Drinking Places
Retail establishments selling prepared food and drinks; lunch counters, and refreshment stands. Subordinate food service facilities leased by outside operators are also included.

Banking
Institutions which are engaged in deposit banking or closely related functions, including fiduciary activities.

Credit Agencies Other Than Banks
Establishments engaged in extending credit in the form of loans, but not engaged in deposit banking. Includes savings and loan associations.

Security Brokers, Dealers and Exchanges
Establishments engaged in the underwriting, purchase, sale, or brokerage of securities and other financial contracts on their own account or for the account of others.

Insurance Carriers
This group comprises insurance carriers of all types.

Insurance Agents, Brokers and Service
Includes agents and brokers dealing in insurance, and organizations offering services to insurance companies and to policy holders.

Hotels, Motels and Tourist Courts
Commercial hotels, motels, and tourist courts, primarily engaged in providing lodging, or lodging and meals for the general public. Does not include apartments, rooming houses, and recreational camps.

Automobile Repair Shops
Establishments primarily engaged in furnishing automobile repair services to the general public.

Electrical Repair Shops
Establishments primarily engaged in the repair of electrical equipment except armature rewinding and electric motor repairs.

OCCUPATIONAL GROUPS[1]

For purposes of this Study, surveyed occupations were classified under the following major occupational groups. All surveyed occupations are sub-professional and none fall below the semiskilled level.

Clerical Occupations

For women, clerical work is a particularly important field of employment. About two-thirds of all clerical workers are women, and almost one-third of all women who have jobs of any kind do clerical work.

Workers in this group do a vast amount of record keeping and paper work required in modern business; they handle communication through mail, telephone, telegraph, and messenger services; and they attend to shipping and receiving of merchandise, ring up sales on cash registers of stores and restaurants and do related kinds of work. One out of four clerical workers in the United States in 1960 was a stenographer, secretary, or typist.

The expected rise in clerical employment in the next ten years would probably be much greater if it was not for the increasing use of mechanical equipment for many routine clerical tasks.

Sales Occupations

Sales workers are the link between the producers of goods and services and the consumer. The list of what sales workers sell would be practically endless.

Sales occupations afford many job opportunities for workers with widely different educational backgrounds, work experiences and personalities.

More than half the sales people work in retail trade, and another large group work for wholesalers and manufacturers. Another group is Insurance and Real Estate salesmen. In addition there are many small sales occupations such as peddlers and newsboys.

Service Occupations

Service workers help to protect people's lives and property and add to their comfort and conveniences in many other ways. These occupations are of many different kinds and afford opportunities for workers with different backgrounds and personal qualifications. Many service occupations require workers with considerable skill and training; others require comparatively little. Chefs and cooks in restaurants must be specially trained for their work, either in school or on the job. On the other hand, maids, charwomen, and janitors need little, if any, special training. A pleasant manner and nice appearance, and a special knack for dealing with people are particularly important for waitresses and hostesses. Turnover is high in these occupations for several reasons—the high proportion of women, many temporary and part-time jobs, and the relatively low rates of pay.

Skilled Occupations

Skilled workers help to transform ideas and plans of professional workers into goods and services, and are employed in almost every branch of industry. Skilled workers must have a thorough knowledge of the processes involved in their work. They exercise considerable independent judgment, and often need a high degree of manual dexterity. In some instances they are responsible for valuable equipment or products. Workers in skilled occupations usually receive extensive training.

Semiskilled Occupations

Many semiskilled employees work as machine operators, as helpers or assistants to skilled workers. In general, semiskilled employees work with their hands. Many times, they have had only brief on-the-job training. The ability to learn new tasks is perhaps more important for the entry semiskilled workers than is educational attainment.

Semiskilled occupations are more likely to be affected by economic conditions and automation.

[1] Based on the "Dictionary of Occupational Titles" of the Bureau of Employment Security, United States Department of Labor.

Survey titles and definitions with cross references to the "Dictionary of Occupational Titles" and DOT codes.

Clerical Occupations

ACCOUNTING CLERK: Performs routine calculating, typing, and posting duties in accounting. Checks items on reports, summarizing and posting data to designated records. Performs other duties such as making up invoices or monthly statements, preparing payrolls, verifying bank accounts, keeping record files, making up periodic reports of business activities, and listing and checking details as instructed. Includes Cost Clerk. (DOT Reference—ACCOUNTING CLERK: 1-01.31)

BANK TELLER: Performs a service for bank customers by receiving, paying out, and keeping accurate records of all money involved in banking transactions. Receives deposits and pays out withdrawals. Records the daily transactions and balances accounts. May supervise one or more clerks who record details of transactions. (DOT Reference—BANK TELLER: 1-06.02)

BOOKKEEPER: Keeps complete and systematic records of establishment's business transactions. Balances books and compiles reports at regular intervals to show receipts, expenditures, accounts payable, accounts receivable, profit or loss and other pertinent items. May calculate wages of employees and make up checks or draw cash from bank for payment of wages. (DOT Reference—BOOKKEEPER: 1-01.02)

BOOKKEEPING MACHINE OPERATOR: Keeps a set of records of business transactions, using a bookkeeping machine. Types on forms desired data such as: name, address, items purchased or sold, and services rendered. Determines totals, net amounts, and other items, recording final computations on the form. Performs related clerical duties. May make up bills, invoices, and statements on billing machine. In banking institutions, keeps record of individual customer-accounts by debiting withdrawals and crediting deposits. (DOT Reference —BOOKKEEPING MACHINE OPERATOR: 1-02.01)

CALCULATING-MACHINE OPERATOR: Operates a machine that automatically performs the basic arithmetic computations of adding, subtracting, multiplying, and dividing. May make other calculations. May use different types of calculators such as the Comptometer. (DOT Reference—CALCULATING-MACHINE OPERATOR: 1-25.13)

CASHIER: Keeps a record of cash transactions, receipts, and disbursements incident to the conduct of a business. Enters data to proper accounts and periodically balances cash books. Makes change and cashes checks. In hotels and lodging places records all charges against guests. Receives payment and issues receipts. (DOT Reference—CASHIER: 1-01.52)

DESK-ROOM CLERK: Registers and assigns rooms to incoming guests. Checks out departing guests and may receive payment of their account. Maintains records of their reservations, rooms occupied and guests' accounts. Gives information to guests. In large hotel, refers guests to cashier for payment of bills. (DOT Reference—ROOM CLERK: 1-07.60)

DUPLICATING-MACHINE OPERATOR: Makes duplicate copies of graphs, charts, schedules, bulletins, and similar material using a machine that prints from special metal plates onto a rubber blanket, the ink print then being transferred from the blanket onto the blank sheet of paper (offset principle). [1] Item J of the survey questionnaire which is shown in Appendix C.

EMPLOYMENT SECURITY COMMISSION OF NORTH CAROLINA

APPENDIX C
Survey Methodology and Scope

SURVEY METHODOLOGY AND SCOPE

The scope of the survey included 17 industry segments and was limited to those firms insured by the North Carolina Employment Security Law. A stratified random sampling technique was used in sample selection. Each industry segment was treated separately with respect to firm selection and inflation of data. The sample was selected from lists of insured firms in March, 1963, in the 17 segments studied. Samples were drawn from industry lists of firms arranged in descending employment size. The sample coverage included all the largest firms and a lesser random representation of smaller establishments. Industry sample selection ranged from 54 to 68 per cent of employment. Of the 2,000 covered establishments selected for the total sample, more than 1,440 returned usable survey questionnaires, accounting for about 48,500 workers or slightly less than 40 per cent of the Statewide total covered employment in the 17 surveyed segments. Sample data were inflated to provide estimates for all covered employment in surveyed industries.

Estimates of replacement requirements are based on prior employer experience and reflect only replacement needs resulting from death, retirement, promotion and other labor force withdrawals; but, do not include job shifting.

The initial survey package mailed to employers included an introductory letter, two copies of the survey questionnaire, a list of occupations with descriptions, and a pre-addressed return envelope. After a two-week period, if a response was lacking, a second request letter was mailed with one copy of the survey questionnaire and a return envelope. Copies of the questionnaire and letters are shown on pages 68 and 69.

Realizing that no employer can forecast precisely the number and types of workers his company will require on a given date in the future, forecasts were requested by the fall of 1964, and by the fall of 1966. If employers did not estimate future company or occupational employment, survey period employment figures were carried over to the two forecast periods, and it was assumed that the employment for that particular company would remain the same.

Included in the list of occupations surveyed were 13 occupations which generally crossed industry lines. These jobs were included in all industry segments surveyed. The remaining occupations were characteristic of a specific industry or industries and were surveyed from lists of occupations especially prepared for use in appropriate industries.

The 54 offices of the North Carolina Employment Security Commission were provided with instructions for completing survey questionnaires, and local office personnel assisted employers in completing the forms when called upon to do so.

Responding employers mailed questionnaires directly to the State Office. Each questionnaire was carefully edited. Questionnaires which could not be used were mailed to area Labor Market Analysts for follow-up. Data were tabulated by the Commission's Department of Data Processing. Stratified sample findings were inflated independently for each industry segment studied, to arrive at universe totals.

SURVEY PLANNING AND EMPLOYER REACTIONS

The following information was obtained by four Labor Market Analysts who personally contacted officials of 80 establishments representing 20 types of nonmanufacturing industries. These establishments are listed on the inside of the front cover. These contacts were made during August of 1963. The purpose of these visits was to validate the wisdom of industrial and occupational selection and the suitability of the proposed mail questionnaire, and to ascertain whether the survey could be conducted without benefit of personal interviews, job definitions, or further instructions.

Employers interviewed were very cooperative, furnished the information requested, and commented frequently on various aspects of the impending mail-type survey effort. As a result of this survey planning, three industries were excluded. A few occupations were combined and other occupations were added to the survey list. The survey questionnaire was revised and an effort was made to fit occupations more closely to specific industries by compiling a separate list of occupations for each industry surveyed. Employers suggested that a list of job descriptions be included with each initial survey questionnaire mailed.

Employers visited expressed interest in needs for basic vocational training to better prepare job applicants for meeting the requirements of business. Informal on-the-job training for new workers was the common practice. In the 80 establishments visited, formal training programs were provided for only 11 of the surveyed occupations. On the trial run, more than 60 per cent of the responses showed employers had difficulty in recruiting workers for surveyed occupations.

Employers expressed great needs for trained salesmen and sales clerks who have the necessary desire, aptitude and personal attributes. General training would be supplemented by specific training by employers.

Restaurant owners saw a need for short training periods for waitresses in table setting, serving, and speech and manner. They said that good cooks were always in demand, and that the quality of personnel now employed could be improved by courses sponsored by Industrial Education Centers.

According to these employers, institutional training for persons entering any type of occupation requiring mechanical skills would greatly benefit both the worker and the employer.

Sixty of the 80 employers contacted favored institutional training to help meet future employment needs. Major occupational groups were ranked by employers in the following order, according to the need for institutional training:

1. Skilled
2. Clerical
3. Sales
4. Service
5. Semiskilled

Employers who were interviewed recommended institutional training for from six to 24 months in the skilled occupations surveyed, two weeks to 12 months in service occupations, and from one to 12 months in clerical and sales occupations.

Major occupational groups were ranked by employers in the following order, according to difficulty in recruiting workers:

1. Skilled
2. Sales
3. Service
4. Clerical
5. Semiskilled

Employers believe that the future installation of data processing equipment will replace some clerical workers especially in the banking industry. The use of computer systems, however, is expected to bring into being new occupations.

Signed: John Employer (NAME OF PERSON COMPLETING FORM) — Manager (TITLE) — October 10, 1963 (DATE)

EMPLOYMENT SECURITY COMMISSION
OF
NORTH CAROLINA

P. O. BOX 500
RALEIGH, NORTH CAROLINA 27602

Mr. John Employer
North Carolina Services, Incorporated
1964 Trade Street
Statewide, North Carolina

Dear Sir:

In planning programs for providing training in shortage occupations, State agencies engaged in vocational education must have current information relative to occupations in which qualified workers are most needed. Furthermore, this type of occupational information is important to youth interested in making informed career choices, to unemployed persons seeking job opportunities and to employers in planning for their own future occupational needs.

In order to identify those occupational areas in which vocational training programs would be beneficial to you and other employers, and to individuals in need of training, the Employment Security Commission in cooperation with the State Board of Education is undertaking a statewide study of selected nonmanufacturing industries, of which your business is a part.

You, as a representative employer, can contribute to this study by completing the enclosed questionnaire and returning it, as soon as possible, in the post-paid, pre-addressed envelope provided. A duplicate of the survey form is enclosed for your use and your files.

The information which you furnish will be held strictly confidential - no individual employer will be identified. A copy of the survey results will be mailed to you when the study is completed in early 1964.

May we express our appreciation for your participation in this occupational survey.

Sincerely,

Henry E. Kendall
Chairman

Statewide, North Carolina

Dear Sir:

Recently we sent you a questionnaire seeking labor market information for selected occupations.

In case your form has been misplaced, we are enclosing another and request that you complete and mail it to us in the self-addressed envelope which requires no postage.

We assure you that all information furnished will be treated confidentially, and that all data will be combined in a composite study to be used by employers, school authorities, vocational counselors and others.

Your reply is most important because the accuracy of our findings depends on the response of each individual employer. If you have already returned your questionnaire, please disregard this letter.

Sincerely,

Henry E. Kendall
Chairman

INTRODUCTION

A safe environment is an essential part of the school safety education program. Regular and frequent safety inspections by school personnel—administrators, teachers and students will identify and correct existing hazards.

Inspections may be made at the request of the board of education, the school administration, or upon the initiative of the teacher. Some communities have drawn upon the cooperative service of professional safety engineers, inspectors of state labor departments, insurance companies, and local safety councils to supplement and confirm inspections by school personnel.

DIRECTIONS

WHO INSPECTS?

This will depend upon local policies. It is recommended, however, that shop teachers and students—the student safety engineer and/or student safety committee—participate in making regular inspections. This not only tends to share responsibility, but stimulates a broader interest in the maintenance of a safe school shop.

WHEN TO INSPECT?

As a minimum, a safety inspection should be made at the beginning of every school term or semester. More frequent inspections may be advisable.

HOW TO INSPECT?

Inspections should be well planned in advance and be systematic and thorough. An inspection check list should be used. Inspection reports should be clear and concise, but with sufficient explanation to make each recommendation for improvement understandable.

FOLLOW-UP

The current report should be compared with previous records to determine progress. The report should be studied in terms of the accident situation so that special attention can be given to those conditions and locations which are accident producers. Each unsafe condition should be corrected as soon as possible in accordance with accepted local procedures. A definite policy should be established in regard to taking materials and equipment out of service because of unsafe conditions. The inspection report can be used to advantage as the subject for staff and class discussion.

CHECKING PROCEDURE

Draw a circle around the appropriate letter, using the following letter scheme:

S—Satisfactory (needs no attention)
U—Unsatisfactory (needs immediate attention)

Recommendations should be made in all cases where a "U" is circled. Space is provided at the end of the form for such comments. Designate the items covered by the recommendations, using the code number applicable (as B-2). Space is provided for listing of standards, requirements, or regulations which have local application only.

A. INSTRUCTION

1. Safety instruction is an integral part of each teaching unit. ..... S U
2. Accident prevention is taught with a positive approach. ..... S U
3. The proper use of each piece of equipment is demonstrated before students are permitted to use it. ..... S U
4. Informational safety rules are posted near each hazardous piece of equipment. ..... S U
5. Printed general safe practices are provided each student. ..... S U
6. Instruction is provided on proper methods of lifting, carrying and lowering heavy objects. ..... S U
7. Safety posters are used and are changed frequently... S U
8. Each class has a safety inspector or committee and each student has an opportunity to serve on the safety committee at some time during the four years. ..... S U
9. A procedure is established for students to recognize and report hazards. ..... S U
10. Tests on safety are given regularly as a part of the testing program. ..... S U
11. A complete record is kept of safety instruction, including test records, and is on file. ..... S U
12. First aid instruction is provided to all students..... S U
13. Students are taught the types of fire extinguishers and how to use them. ..... S U
14. Running, horseplay, etc., are completely prohibited.. S U

VT001265

B. PERSONAL PROTECTION

1. Goggles or protective shields are provided and are required for all work where eye hazards exist: grinding, drilling, wire brushing, etc. ..... S U
2. Shields and goggles are provided for electric welding and acetylene welding. ..... S U
3. Respirators are provided for dusty or toxic atmospheric conditions, such as spray painting. ..... S U
4. Coveralls or other appropriate apparel are checked for loose ends when working in the shop. ..... S U
5. Sleeves are rolled above elbows and ties are removed when working around machinery. ..... S U
6. Jewelry (rings, wristwatches, etc.) is not worn when working with machines. ..... S U
7. An adequately stocked first aid cabinet is provided in the agricultural mechanics shop and laboratory and is checked monthly. ..... S U
8. The shop is kept locked when the instructor is not present. ..... S U

C. ACCIDENT RECORDS

1. All accidents are reported to the instructor. ..... S U
2. Accident reports are completed on all accidents, regardless of their nature or severity, and such accidents are reported to the school nurse or principal's office. ..... S U
3. Accident reports are analyzed for instructional purposes and as aids in preventing other accidents. ..... S U
4. Written policies are posted and maintained which outline correct procedures in case of accident. ..... S U

D. THE CLASSROOM AND LABORATORY

1. Equipment and supplies are arranged so that there are adequate aisles for safety and easy exit. ..... S U
2. All compounds and materials are properly labeled... S U
3. Poisonous materials are labeled and kept separate from other materials. ..... S U
4. Proper laboratory procedures are demonstrated before students begin work. ..... S U
5. The laboratory is adequately ventilated. ..... S U
6. Fire resistant materials are used where needed. ..... S U

E. AGRICULTURAL MECHANICS SHOP

1. Shop lighting is safe, sufficient, and well placed..... S U
2. Ventilation is adequate to remove all fumes. ..... S U
3. Floors and aisles are skid resistant. ..... S U

4. The shop has two or more well marked exits. ..... S U
5. Students are familiar with emergency procedures for evacuating the shop. ..... S U
6. All hinged doors open outward and are kept unlocked during shop periods. ..... S U
7. Walls and storage areas are kept clear of objects that might fall. ..... S U
8. Adequate storage space is provided. ..... S U
9. Lockers and storage cabinets are regularly inspected for cleanliness and fire hazards. ..... S U
10. CO_2 fire extinguishers are available for electrical fires. S U
11. Dry powder extinguishers are available for gasoline and oil fires. ..... S U

F. HOUSEKEEPING

1. The general appearance of the shop is one of orderliness. ..... S U
2. All tools and materials are properly stored when not in use. ..... S U
3. Lumber and metal are properly stacked. ..... S U
4. Work benches are kept clear of unneeded materials... S U
5. The shop floor is kept clear and free of water, oil and foreign materials. ..... S U
6. Provision is made for daily removal of sawdust and other waste materials, or they are stored in fireproof, approved containers. ..... S U
7. Approved, properly marked containers are provided for scraps. ..... S U
8. Scrap materials are placed in proper bins promptly... S U
9. A spring-lid metal container is provided for oily waste and rags. ..... S U
10. Storage of supplies and shop projects is arranged for safety. ..... S U
11. The tool and supply room is maintained in an orderly and safe condition. ..... S U
12. Flammable materials are stored in metal cabinets.... S U
13. Dangerous materials, such as gasoline, are stored in approved containers in a separate place. ..... S U
14. Flammable materials are not used for cleaning purposes. ..... S U
15. Washing facilities are kept clean and neat. ..... S U

G. HAND AND POWER TOOLS

1. Special tool racks are provided and kept in an orderly condition. ..... S U
2. Hand tools are kept sharp, clean and in safe condition. ..... S U

3. Students are trained to use the proper size tool for the job to be done. ..... S U
4. Tool handles are kept firmly fastened and free from dirt, oil and grease. ..... S U
5. All hand tools are regularly checked for defects and damage. ..... S U
6. Machines are arranged so that workers are protected from hazards of other machines, passing students, etc..... S U
7. All gears, moving belts, etc., are protected by permanent enclosure guards. ..... S U
8. All machines have proper guards at point of operation. ..... S U
9. All power tools are operated according to manufacturers' directions. ..... S U
10. A student is permitted to operate a machine only after demonstrating his ability. ..... S U
11. Danger zones are properly indicated and marked..... S U
12. Permanently placed machines are securely fastened to the floor or bench. ..... S U
13. Strict supervision is provided for students using hazardous equipment. ..... S U
14. Machines are always shut off when not attended..... S U
15. Brushes are used in cleaning equipment..... S U
16. Unsafe equipment is promptly repaired or taken out of use. ..... S U
17. Grinder wheels are kept in balance. ..... S U
18. The grinder tool rest is maintained within ⅛-inch of the wheel. ..... S U
19. Pusher sticks are available and used on circular saws and jointers ..... S U
20. All equipment is color coded. ..... S U
21. There is adequate lighting for safe work at each equipment area. ..... S U
22. All work is securely fastened when drilling. ..... S U

H. ELECTRICAL SAFETY

1. All electrical control switches are within easy reach of the operator. ..... S U
2. All motors, fuse and switch boxes and other electrical equipment are grounded. ..... S U
3. There is a master control switch for all electrical installations. ..... S U
4. All switches are enclosed. ..... S U
5. Electrical outlets and circuits are properly identified. S U
6. All extension cords are in safe condition and do not carry excessive loads. ..... S U
7. Equipment is provided with overload and underload controls. ..... S U

8. Electrical motors are wired to comply with the National Electrical Code. ..... S U
9. All convenience outlets are grounded. ..... S U
10. All machines and power tools are properly grounded. S U

I. THE SCHOOL AND LAND LABORATORY

1. Machinery and equipment are kept in proper working order. ..... S U
2. The operator is familiar with the operation manual of the machine being used. ..... S U
3. Power takeoff drives on machines are shielded at all times. ..... S U
4. Machines are turned off when being adjusted, repaired, or serviced. ..... S U
5. Machines are used only for the jobs for which they were made. ..... S U
6. Extra care is taken in hitching and unhitching..... S U
7. Farm equipment used on the highway is properly identified with a Slow Moving Vehicle emblem. ..... S U
8. Stairs and walks are well lighted and clear of obstructions. ..... S U
9. Ladders are in good condition and tested before use... S U
10. An appropriate fire extinguisher is available in each farm building. ..... S U
11. All heating and electrical equipment is shielded and grounded. ..... S U
12. All engines are stopped when refueling. ..... S U
13. An adequate water supply is available for controlling fires. ..... S U
14. Fire-fighting equipment is readily available and well marked. ..... S U
15. "No Smoking" signs are placed in strategic places... S U
16. Maximum vision is provided where farm driveways enter the highway. ..... S U
17. All machines and equipment have proper lights for night travel. ..... S U
18. Stocks or other safety devices are used when treating or caring for farm animals. ..... S U
19. Insecticides and other drugs are properly identified and stored. ..... S U
20. Newly stored hay and grain are regularly checked for heating. ..... S U
21. Dated medicines are destroyed ..... S U

J. FIELD TRIPS AND FARM VISITS

1. Rules and laws of the highway are observed at all times. ..... S U
2. Only approved vehicles are used for farm visits and field trips. ..... S U

FIELD TRIPS AND FARM VISITS (continued)

3. All vehicles are checked periodically to keep them in safe operating condition. ..... S U
4. Hazardous areas, such as school zones, hill crests, etc., are given special consideration. ..... S U
5. The rights of pedestrians are respected at all times... S U
6. When walking near highways, everyone faces oncoming traffic. ..... S U
7. Vehicles are not overloaded with either passengers or materials. ..... S U
8. All drivers and passengers are insured for both liability and personal injury. ..... S U
9. Proper signals are given for turns and stops..... S U

*GUIDELINES; *FOLLOWUP STUDIES; *JUNIOR COLLEGES; TRANSFER STUDENTS; TECHNICAL EDUCATION; GRADUATE SURVEYS; VOCATIONAL FOLLOWUP; DROPOUTS; COLLEGE STUDENTS; PROGRAM IMPROVEMENT; *PROGRAM EVALUATION

A guide to the philosophy, planning, and use of followup studies is presented in this bulletin. The content was selected to (1) demonstrate the value of followup studies, (2) give examples of successful practices, (3) provide guidelines for organizing followup studies, (4) suggest implications of information gained from research, and (5) encourage more 2-year colleges to collect necessary data and apply them toward improvement of their programs. Two-year colleges must be especially sensitive to all sociological and technical changes and followup is an indispensable aid to their vitality, efficiency, and productivity. Some uses of followup data are (1) establishing student characteristics norms, (2) evaluating entrance requirements, (3) appraising counseling services, (4) evaluating placement services, and (5) ascertaining the usefulness of the public relations program. Sample questionnaire forms are given for 17 purposes such as (1) occupational followup, (2) alumni information, (3) withdrawal analysis, (4) counseling evaluation, and (5) curriculum evaluation. FOREWORD

The most important person in the junior college is the student. What happens to the young man or woman while in the college, and even after matriculation, must be of primary concern to all who are involved in the educational process. The success of the institution can best be measured by the success of the student.

To ascertain the effectiveness of the college program, there must be "follow-up"—from the day the student enters the institution until, and even after, he gains employment or transfers to another institution. Simply defined, follow-up is a process by which an educational institution seeks to determine how effectively it is meeting the needs of those it serves. Introspective by nature, it determines how well the stated objectives of the college are being achieved.

Recognizing the importance of the follow-up process as a means of evaluating the impact of college experiences on students, the American Association of Junior Colleges presents in the following pages a guide to the philosophy, planning, procedures, and use of follow-up studies. "Follow-Up Studies in Junior Colleges: A Tool for Institutional Improvement" also contains sample forms which have been used successfully in this important, institutional research process.

In sponsoring this bulletin, the Association demonstrates its belief that well-planned follow-up studies should become an integral part of the institutional research program of every college. Junior colleges have tended to give greater attention to evaluation of instruction and administration than to appraisal of the student's goal attainment. Institutional research will be of little use if it does not take into account the results of the college's efforts toward meeting the aspirations and objectives of the people to be served.

This bulletin has been designed as a handbook of practical approaches to gathering data and conducting research on factors which influence student accomplishment. The content is selected to (1) demonstrate the value of follow-up studies, (2) give examples of successful practices, (3) provide guidelines for organizing follow-up studies, (4) suggest implications of information gained from research, and (5) encourage more two-year colleges to collect necessary data and apply them toward improvement of their programs.

While this handbook suggests that follow-up studies are an appropriate responsibility of the student personnel division of the junior college, it at once emphasizes that results of this kind of research are of primary concern to the entire college, especially to instruction, curriculum, and administration. Such studies, it is made clear, are an integral part of institutional research; and when they are conducted from a student personnel point of view, they can do much to bridge the artificial dichotomy of instruction and student personnel services.

Finally, this bulletin recognizes that studies of students after they leave junior college are more helpful when adequate data about the students have been collected while they are enrolled in the institution. Moreover, the bulletin recognizes that evaluation studies of performance of students while they are enrolled provide an invaluable basis for interpreting post-graduation performance.

"Follow-up Studies in Junior Colleges: A Tool for Institutional Improvement" is one of a series of publications in the guidance and counseling field being prepared by the Student Personnel Commission of the American Association of Junior Colleges. The author, Thomas J. O'Connor, is assistant superintendent of Mt. San Antonio College in Walnut, California. His experience in coordinating administration, instruction, and student personnel services in one of the nation's large community colleges is reflected in the guidelines which this bulletin provides.

This bulletin and others in the series have been prepared under the direction of Dr. Herman Sheffield, president of San Bernardino Valley College and Dr. John Johnson, president of Santa Ana College, working as co-chairmen of a committee of the Commission on Student Personnel, American Association of Junior Colleges. An advisory committee suggested content and organization and reviewed the manuscript.

The American Association of Junior Colleges is appreciative of the efforts of Mr. O'Connor, the advisory committee, the Student Personnel Commission, and Dr. Thomas B. Merson who provided staff services to the commission during the development of this bulletin.

Part I

IMPLICATIONS FOR PEOPLE AND PROGRAMS

Educators who have had experience in the development of new junior colleges are well-acquainted with the necessity for conducting preliminary surveys to determine socioeconomic and population descriptions of areas to be served. They also understand the importance of studies of high school graduates to determine potential college enrollments, as well as to ascertain academic and occupational goals and interests of prospective students. The value of information gained from this kind or research in establishing the initial programs of study for the new institution is self-evident.

But research, study, and evaluation should not end with the opening of a college. In a time of change in community structure, in the face of fast-moving industrial development, there must be continuous and effective research on the student and the entire college program. Follow-up research is as important to the junior college as market research is to a pioneering business. Without the data obtained from such research, it is impossible for junior colleges to respond quickly and effectively to the dynamic forces which shape and change communities and which have such obvious impact on their citizens.

Follow-up provides the student with reliable information regarding the success of former students transferring from junior colleges to four-year colleges, or entering employment; justifies subject requirements for graduation; gives incentive for developing traits and competence in ways shown to be requisite for future success.

Follow-up provides the instructor with firsthand evidence of the effectiveness of his teaching, the reasonableness of his standards, and the relevance of the material he includes in his courses.

Follow-up gives the counselor a factual basis for advising students regarding career choices, sources of advanced study, course selection, extracurricular participation, and success expectation.

Follow-up provides the college with facts upon which to base admissions policies; develop and organize course content; establish performance standards; improve articulation with parents, high schools, senior colleges, and industry; and suggests a means of planning new curriculums and other extensions of educational effort.

Follow-up offers the community means of identifying gaps in educational service; creates confidence in the efforts of the college; increases the productivity of college-trained recruits; and provides means of insuring effective occupational upgrading.

The need for institutional research in the community junior college is imperative, perhaps even more so than in the four-year institution. Two-year colleges must be especially sensitive to all sociological and technological changes if they are to meet the needs of business and industry and at once satisfy the requirements of students with a broad range of interests, aspirations, and abilities. Moreover, junior colleges have only two years, sometimes less, in which to make an impact on their students. Follow-up, therefore, is an indispensable aid to vitality, efficiency, and productivity of the institution.

The question may be raised as to the scope of follow-up studies. The answer, of course, will vary, but generally such research embraces three basic concepts, whether the study is based on the total program of the college or on a particular segment of the program: (1) clarifying what the college is attempting to do; (2) identifying the important tasks among its many activities; and (3) evaluating the effectiveness of its programs and efforts.

Examinations and evaluations of student progress and development involve certain costs which may appear prohibitive in some cases. However, costs can be kept to a minimum if research is confined to a specific area of the college's program. A study of the college, on a section-by-section basis, while obviously suggesting a long-range plan, may even produce better results in the final analysis.

Community junior colleges offer educational opportunity for students with a wide range of interests, abilities, and past achievement,

to move them toward goals which they might not reach without post-high school education. Thus, two-year colleges recognize responsibility for providing a variety of courses to match the characteristics of the students they enroll. These courses must be planned (1) to provide a number of starting points; (2) to provide for differing rates of achievement; (3) to provide many choices of direction; and (4) to provide several profitable stopping points. The aim of these programs is to develop maximum competence in each student and immediately move the student toward his objectives.

Such differential treatment requires a flexible administration, versatile instructors, and most important, a counseling staff fully informed about the characteristics of students and the relationship of specific characteristics to success in particular fields. To fulfill this responsibility, a college must collect, analyze, and use information about its students. The college begins by collecting information to guide its admission selection; by continuously using the information to assist students in achieving maximum success; and by evaluating occupational proficiency or transfer achievement after the student has moved from the junior college into employment or to a four-year institution.

The college must be concerned with (1) characteristics of the total student body; (2) characteristics of special groups such as the very able, the underachievers, and the slow learners; (3) characteristics of students in individual courses; and (4) characteristics of individual students.

Student groups provide a sound basis for formulating college policy with regard to admissions, course placement, curriculum, and instruction. But research on students in groups is not enough. Analysis of performance of individuals is mandatory if the college is to serve effectively the wide range of student requirements. If both student welfare and college effectiveness are viewed as important reasons for studying students and their success, it is obvious that these studies must be conducted before students are admitted, while students are enrolled, and after students graduate.

Follow-up studies serve to measure effectiveness of instruction, curriculum, and student personnel services. Specifically, data obtained from such studies can provide bases for:

- Reducing the number of students who leave, or drop out of, college before satisfactory completion of work
- Establishing norms on aptitudes, socioeconomic status, vocational aspirations, and other characteristics
- Assessing the degree to which curriculum and instruction are adapted to the full range of student and community needs
- Improving the effectiveness of technical-occupational curriculums, courses, instruction, and guidance
- Determining modifications required in transfer programs to provide strong preparation for advanced study
- Evaluating grading standards
- Identifying outstanding instructors and counselors
- Evaluating the effectiveness of entrance requirements
- Appraising the effectiveness of student counseling
- Verifying the validity of the testing program
- Measuring the extent and worth of health and clinical psychological services
- Evaluating the competency of placement services
- Determining the effect of extracurricular activities on student development
- Clarifying the effectiveness of record-keeping procedures
- Ascertaining the usefulness of the public relations program
- Measuring the values of the orientation program

STUDENT DROPOUTS

One of the most costly, perplexing, and persistent problems faced by junior college administrators is that of student dropouts. Studies of this problem usually do not result in reduction of the number of students leaving college before completing their work, perhaps because such examinations are usually conducted on a sporadic rather than an ongoing basis. A sustained analysis of the problem might well yield more effective solutions. Follow-up studies must include an analysis of dropouts.

Dropouts are students who terminate their enrollment before they have achieved their educational objectives. Statistics which count all students as dropouts who have not completed two full years and grad-

uation requirements are misleading because many students complete their educational goal in less than two years. Students appropriately counted in dropout studies are those who go through the process of preadmission testing, counseling, and registration, and formally enroll in classes but who withdraw before completing the program in which they are enrolled. Some students may complete all preenrollment testing and counseling but will not enter classes. Other students withdraw during the first semester or during a subsequent semester. Still others elect not to continue at the close of one of the school terms.

Obviously, accurate counting of bona fide dropouts is an essential prerequisite to an accurate analysis of the causes of dropouts. Second, it is of great importance to ascertain all the factors that may have contributed to the students' withdrawal from the institution. The college has an obligation to determine why students leave college prematurely, particularly as regards deficiencies in the college program that may have effected their withdrawal.

Moreover, the size of the dropout component has major implications for operating the junior college. By predicting operations, financial outlay, staffing, and facilities development on what may be false enrollment statistics, the college stands to suffer budgetary losses of sizable proportions. Expenses incurred in processing students who subsequently drop out are, in themselves, sizable.

NORMS OF STUDENT CHARACTERISTICS

In planning its program, the junior college must take into account national and local norms that may relate to conditions which affect student progress. It is essential, for example, that the college have information about national and local norms on student intelligence, socioeconomic status, marital status, educational goals, and levels of preparation.

Such data can be obtained from national and local admissions and student personnel records. By comparing such basic facts about local, state, and national student populations, follow-up studies can be interpreted with maximum meaning and validity. Furthermore, as colleges gain more experience in surveying students' characteristics, problems, and development, added insights into requirements for additional in-

formation and kinds of facts that should be included in personnel records will be gained.

ADAPTATIONS OF CURRICULUM AND INSTRUCTION

Junior colleges are often called "community colleges" because their curriculums reflect the social, economic, and industrial life of the communities they serve. To insure a proper orientation to local needs, colleges often organize advisory committees—composed of representatives of professional, business, and industrial interests—to assist in the establishment of new courses and curriculums, or to review existing programs in terms of changing needs.

Follow-up procedures should be employed to make certain that the college programs are serving the needs of the community, and do, in fact, reflect the social and economic status of the population. It would be ill-advised, for example, for a community college to overemphasize preprofessional training in a community where technical and semiprofessional programs would be more appropriate both for high school graduates and for local manpower users.

To verify whether the junior college is reflecting in its program the needs of the community, follow-up surveys of each graduating class should be conducted. This is especially true where there is a great flux in population and change in industrial development. Such studies will reveal the number of students transferring to four-year colleges and the number of technical-occupational graduates being placed locally. A further breakdown of the latter figure will give an indication of the specific businesses and industries that are absorbing community college graduates. Such information, in turn, should provide a valid basis for eliminating curriculums which are not serving local, state, or national manpower needs and for adding new programs required by employment changes.

VOCATIONAL-TECHNICAL PROGRAMS

Rapid changes in technology mandate continuous revision of technical instruction. Feed-back of information from recently employed students provides one of the best means of obtaining an evaluation

of the relevance of course content, instructional emphasis, and student advisement to the actual demands of employment. Two years or less is a short time in which to prepare students for technical and semi-professional careers. Several perennial questions face curriculum builders and student advisers:

1. What proportion of the student's program should be general education, and what part technical education?
2. What are the essential general and technical education components?
3. To what extent should technical education be specialized?
4. How much emphasis should be given in technical courses to theory and how much to skills and application?
5. How much and what kind of related, supplementary science and mathematics should the technical student be required to master?
6. What combinations of native ability and technical aptitude and proficiency are requisite for successful careers in various kinds of employment?

Follow-up studies provide some answers to these questions. Unfortunately they do not always clearly indicate the necessary course of action because replies from students after they have become employed may contain conflicting recommendations. For this reason, individual replies must be studied in order to determine the factors which are common to employment in a given position in a given field, and also to uncover differences which are related to individual employers, rather than to fields of employment.

Studies of this type are particularly helpful to advisory committees. When a committee has substantial data about graduates, it frequently is in a better position to recommend changes in employment practices as well as to recommend changes in curriculum, instruction, or advisement. When the bonds of partnership between the college and industry are strengthened in this way, all involved benefit—especially the student.

TRANSFER PROGRAMS

Junior colleges often are judged as to their effectiveness largely on the basis of the success of students who transfer to four-year colleges and universities at the end of two years. Accreditation teams direct substantial attention toward transfer courses, perhaps because these teams feel they can best judge this effort of the two-year college. Colleges must systematically survey and analyze programs of transfer students in order to insure that the experiences offered in the junior college will lead to success in upper-division work. Such continuous evaluation may result in changes in teaching materials, revision of examination and testing procedures, modification of course content and changing course prerequisites.

Successful preparation of students for upper-division work requires knowledge of: (1) the characteristics of the four-year colleges to which students will transfer; (2) the numbers of students who transfer to each college; (3) the major fields in which the transfer students enroll; (4) the success of previous transfer students in various upper-division major fields of study in these colleges; and (5) problems frequently encountered by transfer students. When adequate data are collected by the junior college on these points, liaison with the four-year college will be strengthened.

Success of transfer students is usually measured by: (1) grades earned after transfer; (2) the number achieving honors, and those earning less than an average grade; and (3) the differential between grades earned in the junior college and those earned after transfer. Annual follow-up studies should routinely analyze these factors.

GENERAL EDUCATION

Little systematic study is made of the effectiveness of general education requirements in two-year colleges. Yet, counselors, advisers, and instructors claim that this phase of the student's education is extremely important, and graduation requirements usually demand completion of some general education pattern. The results sought from general education are admittedly difficult to measure but their importance seems to warrant more effort towards evaluation.

It is difficult to ascertain the combination of program and experience that will produce lasting impact on communication skills, critical thinking, health habits, and values, or the kind of preparation which gives tangible evidence of influencing an individual toward better personal and social adjustment, citizenship competence, and stable family relationships. Intensive follow-up studies along these lines would seem to be as important as follow-up studies which assess the level of competence developed in any other program of the college.

GRADING STANDARDS

Both philosophical and practical problems are associated with the establishment and maintenance of grading standards which are appropriate for the various objectives of a comprehensive, two-year college. Continuous review of grading practices of individual instructors and of special courses and curriculums is essential. Grading practices must be related to educational objectives and to student characteristics. Many new instructors require time to appreciate the need for multiple grading standards. Follow-up studies provide more helpful data in determining realistic standards than is provided by any other source of information.

Tendencies toward either lenient or excessively severe grading may be detected by systematic analysis of grade distributions each semester. If individuals or departments are found to have given a disproportionate number of high grades, there is opportunity then to schedule conferences and examine grading philosophies and systems. Evidence from follow-up studies provides a sound means of validating grading standards. Likewise, it is possible that extremes in grading may be revealed by such studies.

Many other statistical inferences can be gained through study of grade distribution. For example, this type of follow-up will reveal how many students withdraw unofficially from college, how many withdraw with failing or passing grades, and how many receive administrative failing grades for nonattendance. The implication for further research on grades constitutes another promising area for follow-up studies.

ANALYSIS OF INSTRUCTORS AND COUNSELORS

Follow-up studies provide one means of measuring the effectiveness of instructors and counselors. Student assessments of the helpfulness of faculty and staff, ascertained in yearly or frequent studies, are one of the best sources of data for staff improvement.

Students will be quick to point out instructors whom they considered to be overly demanding or lacking in understanding, and those who showed patience and comprehension of student problems. They will give their opinions on the counseling and individual attention received. While the attitudes of departing students toward instructors and counselors must be analyzed carefully, they do identify problems that may assist in faculty and staff development.

ENTRANCE REQUIREMENTS

When a student is admitted to a college, he should have high expectation of success. In most cases, the student should not be admitted if the college does not offer a program or programs in which the student has a reasonable possibility of success.

Two-year colleges vary in their admissions criteria and standards. Some are highly selective, and others, by law or by preference, subscribe to the "open door" policy, admitting all high school graduates and those over 18 years of age who can benefit from college experience. Colleges with liberal admissions policies usually place restrictions on admission to certain curriculums within the institutions, thus assuring that some students do not enter programs where their opportunities for success are negligible.

The effectiveness of screening procedures in all junior colleges is germane to follow-up studies. Constant review of admissions requirements is necessary. Failure of the college to evaluate and use admissions requirements for specific majors and curriculums can lead students to select courses in which failure is almost certain. When an inordinate number of such failures occurs, the cost to the college is high and unjustifiable.

Preservation of standards and exercise of prudence by faculty and administration in proper use of funds are expected and demanded.

Although junior colleges frequently do act as catalytic agents in resolving the vocational and educational objectives of their students, many false starts and much time and expense could be saved by analyzing, through follow-up, the effectiveness of admissions requirements and course prerequisites. Sometimes the implications of these studies indicate the need for establishing new cut-off scores on tests, or the development of new tests and other admissions procedures.

Enrollment studies will show the number of students seeking enrollment in specific programs and courses which employ screening criteria; the number of students rejected; and the number who succeed and fail in each course or program. Follow-up will be effective, then, as a measure of predicting success, not only in college, but also in specific courses and curriculums.

Continuous follow-up study of placement and admissions tests also provides the college administration with an excellent means of predicting numbers of class and laboratory sections, in estimating numbers of transfer and technical-occupational students, in forecasting the number of part-time students, and in estimating the number and types of remedial sections required. Such information, or the trends it suggests, can also assist greatly in predicting faculty and facility needs.

COUNSELING AND GUIDANCE

Counseling is considered by many authorities to be one of the principal functions of junior colleges. Many counselors believe that the greatest challenge to their competencies lies in counseling in junior colleges. Reasons for these beliefs have their origin in the variety and complexity of the curriculums in the vocational indecision of many students, and in the variety and potential and performance of individuals in the heterogeneous student body.

At the time they enroll in junior college many students may be substantially unaware of their vocational objectives, their majors, their capacities, and their interests. Some students have experienced near failure in high school and face major problems of orientation. Many students with aspirations to enter four-year colleges immediately

following high school find that they are ineligible, so adjustments in attitudes and objectives become necessary. Another group of students posing a challenge for counseling and instruction is composed of persons possessing adequate ability and interest but having minimal previous formal education. There are also those who are eligible to enter baccalaureate programs immediately after high school but who need help in selecting majors and in choosing appropriate four-year colleges. Proper placement, timely encouragement, and direction are necessary for their assistance. Other students, who may be misguided in their objectives, will require directive counseling into those areas wherein they may have interest and potential of success.

The transfer student, in many cases, profits from guidance in selecting a college to continue his upper-division study. The counselor will be asked to help him make this selection. All transfer students reasonably expect counselors to interpret the four-year colleges in terms of admissions requirements, philosophy, prerequisites, and subject matter.

Vocational guidance is only as effective as it is realistic, current, and meaningful to the student. A great many high school students enter junior college with hazy concepts of their vocational goals. Many of them who are not qualified will indicate intent to transfer to a four-year college because they feel vocational programs lack prestige. They need realistic counseling and orientation to the world of industry and business which will help them discover their potential, and reassure them of their worth to society in a nonprofessional career.

Follow-up studies of counseling services will indicate the effectiveness of the guidance program in aiding students to select courses of study consistent with their abilities and with the needs of the community. Studies may show needs for additional counseling personnel; for an in-service training program to insure adequate and current counseling; or for improvement of some other particular aspect of counseling. The effectiveness of the counseling staff in assisting students to achieve success is best evaluated by systematic follow-up studies.

Testing

Test data for each student must be compiled before the student is scheduled for an interview with a counselor. Test scores serve as a

basis for placing students in classes where they may succeed and also be challenged, to determine vocational choices, to estimate probability of success in various curriculums, and to establish norms by which students may be compared with students in other colleges. How well all of these functions are served by testing is an essential part of follow-up procedures.

From follow-up studies of testing, valuable insights will be gained concerning the extent to which the student's choices are affected by testing, the predictive value of tests for their performance in the various courses and the curriculum selected, and faculty reaction to the testing program.

Clinical Psychological Services

Generally speaking, junior colleges are not equipped to provide therapy for disturbed students. In many cases, the best course of action is for junior college counselors to refer such students to competent, professional people.

Naturally, counseling personnel are interested in detecting as soon as possible persons who might require or benefit from such guidance. The faculty can note symptoms of abnormal behavior and refer such cases to counselors who, in turn, can identify students who require resources for such specialized assistance from community agencies. A study of this specialized activity is preferably conducted separately from general follow-up studies.

Health Services

Most colleges offer some health services for their students. Although the amount and type may vary, it is desirable to study periodically how effectively the needs of the students and the college are being met. The effectiveness of preadmission physical examinations, immunization, accident prevention and treatment, safety and health instruction should not be overlooked in follow-up studies. Student reaction to such services can give valuable insight into the effectiveness of the health program of the college and provide a reliable basis for modifying or evaluating the existing program.

Placement

Placement is a segment of student personnel services which is pivotal to the successful functioning of a comprehensive junior college. It is imperative that, if placement is to be effective, frequent follow-up studies should be undertaken in order to observe the direction and preserve the quality of its services. College placement has been defined as "a service which assists its student clients in relating their personal qualities, education, and experience to occupational requirements, assists them in their search for employment, and cooperates with employers in the successful induction of the student into part-time and career positions." [1] An evaluation of the effectiveness of this very important aspect of personnel services in junior colleges will concern itself with the qualitative as well as the quantitative aspect of placement. Placement service introspection generally consists of evaluating the adequacy of personnel and their facilities, an examination of the records to determine how many students are placed, what type of guidance they receive regarding job selection, whether they accepted part-time or full-time employment, how effectively they perform on the job, and what feed-back is established to allow the college to formulate judgments concerning reactions of employer and student. Although follow-up is concerned primarily with the results of placement, it is also concerned with the effectiveness of its methods.

Community colleges are often in an enviable position to evaluate placement procedures because of their proximity to employers. Resident colleges are forced, usually, to rely on use of questionnaires to employers and former students in order to secure information, since places of employment may be in localities other than that of the college. No effort should be spared, in either case, to conduct continuing and thorough follow-up studies of placement practices. No better method exists for determining how well the technical-occupational objectives of the college are being carried out.

One of the greatest hindrances to objective evaluation of placement lies in relying on nonprecise definitions of success. Further research

[1] Mohs, Milton H. *Service through Placement in the Junior College.* Washington, D.C.: the American Association of Junior Colleges, 1962, p. 3.

will be required before employment success can be measured accurately enough to provide a valid basis for evaluating the impact of guidance and instruction on job readiness. Systematic follow-up studies, if carefully analyzed, may yield clues to improved evaluative techniques.

Student Activities

Student activities generally denote participation in self-government, interest clubs, social activities, and organized athletics. A well-organized and effective student activity program is dependent, basically, upon the student body's participation in, and conduct of, student affairs. All efforts at beginning an evaluation of the effectiveness of the student activity program of a junior college must commence with an understanding of the philosophy of college officials toward extracurricular activities. College authorities must recognize that education consists of developing leadership and responsible citizenship as well as formal learning.

Usually, mistakes made in a classroom are considered as evidences of the maturation of the individual. But mistakes made in the conduct of student government often are judged to be evidence of student irresponsibility. Complete success in student government is as rare as complete success in a classroom. The most important part of the student government program is the process, not the accomplishment of the activity. Student appraisal of the activity program should be sought because there is a strong relationship between an effective activity program and student morale. A periodic, systematic evaluation of the student activity program should be conducted to ensure that this program is contributing to the development of socially mature students.

Housing and Dining Services

Residential colleges uniformly emphasize the educational advantages for students of varied backgrounds living together on campus. Such a mingling provides opportunity for educational enrichment and for development of social responsibilities when the dormitory is used

as an educational unit. Colleges have discarded the idea that their responsibility ends when the student is assigned a room and given a meal ticket. College dormitories are not hotels wherein casual relationships exist between the proprietor and the guest; rather the guest is a student and the proprietor is an educator throughout the day.

Follow-up studies will show how well the college is providing the following residence services:

1. Adequacy of living quarters and meals
2. Balance in privacy and social interaction
3. Appropriate regulations and supervision
4. Effective student control in developing personal responsibility
5. Availability of competent personal guidance within the residence hall.

Community colleges which do not have residence halls find their student centers provide opportunity for many of the advantages of residence hall living. Follow-up studies are helpful in improving opportunities in the student center or the residence hall for informal social experiences which may give the student a feeling of identity with the college.

Records

The establishment, maintenance, and proper use of records provide the broad basis for all examination and analysis of student progress.

Carefully planned records, which include essential or important information, not only make student personnel services more effective but also are essential to meaningful follow-up procedures. Excellent records of three types are essential: (1) admissions information, (2) academic achievement, and (3) student personnel information.

Colleges usually have established policies regarding specific categories of information which are to be collected for use while the student is enrolled, and other information which is to be retained permanently. Use of microfilm and data processing tapes reduce the storage problem, especially in colleges with large enrollments. Information about students, which should be retained permanently, will answer questions about the student's background, his progress and

achievement in college, his record on qualifying examinations, counseling data of a nonpersonal nature, his student activities records, and other information needed for letters of reference.

A new development in record keeping is that of utilizing the student's social security number as the identifying code number. This system has proved helpful in avoiding duplication of information and provides easy access to records when they are needed. When such practice becomes common it should greatly simplify the task of locating former students for purposes of follow-up studies.

The quality of the record system of a college will be immediately evident when these records are used to interpret information obtained in follow-up studies.

Public Relations

Because an important part of student personnel services in junior colleges begins before the student enrolls in college, attention in any follow-up study should be directed toward the means used to inform parents, high school students, and the public in general of the educational opportunities of the junior college. This aspect of the public relations endeavor is frequently conducted by the student personnel staff and is accomplished through the press, addresses to civic groups, by "College Night" programs at high schools, by addresses to high school students, and through college publications.

Follow-up studies should seek to determine how effectively the college image is being projected in the community. It would be a mistake for a junior college to assume that its community is fully acquainted with the college and its programs merely because the college has been in existence for a long time. Changing populations, with the influx sometimes coming from sections of the country where no junior colleges exist, must be oriented to the junior college. Lack of understanding is all too common. Some junior colleges, perceiving that counseling alone cannot accomplish the task of informing the public of the functions of the junior college, have established public information offices appropriately staffed for the public relations job.

Follow-up studies should seek to provide information by which the college may judge the impressions entering students have of the

college and its programs at the time they enroll. With proper information, realistic orientation programs can be planned and improvement of preenrollment publicity may be implemented.

Orientation

The procedures by which a college orients its new students should be evaluated in follow-up studies. Students differ in the value they ascribe to such activities as "Freshman Day," explanation of college rules and regulations, and campus tours. In the evaluation, it is important to ascertain the activities which most influence the student in achieving an identification with the college and the activities which reduce the time required by the student to adjust to the demands of college life and routine.

In addition to "Orientation Day" programs colleges schedule group guidance orientation classes for part or all of the first semester. Such courses help students to improve study habits, evaluate interests and aptitudes, interpret the meaning of test scores, and provide assistance in improving personal and social adjustment. These classes, when taught by the student's counselor, pave the way for effective, individual conferences which can be devoted to interpretation rather than explanation. Follow-up studies enable the college to correct false impressions about effective orientation practices and to retain those activities judged beneficial.

Part II

FOLLOW-UP PROCEDURES

Procedures and methods by which a junior college may develop and employ follow-up practices in an effective manner are varied. When the personnel services are of a comprehensive nature touching upon the total collegiate program of the student, it seems logical that the student personnel staff should conduct, or at least coordinate, the follow-up studies. Colleges which employ directors of research may find it advantageous to center all studies in the research office. If the study is well-designated and well-planned and the results are disseminated to the appropriate departments of the college, the office to which the study is assigned is not of great importance.

The effectiveness of a follow-up study frequently bears a direct relationship to the time and care devoted to planning it. An important step in launching a follow-up study is to insure that both the administration and the faculty are in agreement on the values to be derived. Joint planning by both faculty and administration usually results in a more effective study and in more widespread use of its findings. A steering committee of faculty and administration, including representation from both instruction and student personnel services, should be established. This committee will define and delimit the study, formulate procedural guidelines, design the study, and structure the methods to be used in carrying it out.

The principal tools employed in follow-up studies are record analysis, interviews, and questionnaires, or a combination of such devices. If questionnaires are to be used, care should be given to their formulation. Questions which are ambiguous and incomplete usually elicit responses in kind. The combined talents of the faculty members of

the sociology, psychology, and mathematics departments should be sought in designing follow-up questionnaires and in interpreting the responses to them. Knowledge of research techniques and sampling methods will do much to reduce costs and to increase the effectiveness of the surveys.

It is recommended that interviews be used wherever possible. The personal nature of an interview will assure greater rapport than can be obtained through a questionnaire. Students are usually eager to cooperate when representatives of the college call upon them. Interviews also have the advantage of providing opportunity for expansion and explanation of student opinions.

However, in conducting an interview which will have validity it is advisable for the junior college representative to work from a prepared questionnaire or check sheet in order to insure comparable inclusion of all topics to be assessed by the study. To preserve the feeling of personal contact, it is recommended that the interviewer, rather than the student, record the statements made in the interview. Care should be exercised not to lead the student into making statements which do not actually represent his opinion.

When expense, distance, time, and other factors preclude interviews, a thoughtfully developed questionnaire can secure much valuable follow-up information.

In the following pages practical approaches to organizing and conducting follow-up studies are described for three selected categories: transfer students, technical-occupational curriculum graduates, dropouts and withdrawals.

FOLLOW-UP STUDIES OF TRANSFER STUDENTS

The follow-up study on transfer students should be concerned with:

1. Determining the colleges to which students transferred
2. Ascertaining major fields of study of transferring students
3. Observing changes in the student after transfer
4. Discovering admission problems and problems of acceptability of junior college courses
5. Comparing the students' performance at the four-year college and the junior college

6. Obtaining the students' opinion of the quality of preparation provided in the junior college

7. Ascertaining areas of strength and weaknesses in the junior college program

8. Verifying correlation of subject matter taught at the junior college with that of the four-year college

9. Observing at what period of junior college education most students transfer, and the relationship of the period of attendance at the junior college to success in the senior college.

An important decision to be made in initiating the study of transfer students is the selection of four-year colleges to be included in the study. Usually a major portion of the graduates of particular junior colleges transfer consistently to a small number of colleges, and the remainder transfer to a variety of others. In most instances, very little research is needed to determine to which colleges the bulk of the students have transferred. It is much more difficult to locate the students who have elected to attend colleges which attract only a few of the graduates. Requests for transcripts will help determine the destinations of transfer students. In some cases, the four-year colleges provide a roster of those students who have enrolled, as well as invitations to visit the students. In the final analysis, the decision as to the number of colleges to be included in the study will be based on the distribution of transfer students; the method of research used, whether interview or questionnaire; and the finances available to conduct the study.

The degree of comparability of instruction and instructional standards in junior colleges and four-year colleges is one of the most important findings of transfer follow-up studies. It is also one of the most difficult to obtain accurately and in depth. One way of determining comparability of instruction is to compare grade-point averages achieved by the same student at each institution. When the grade differential between institutions is very high, (over one-half a grade point) an analysis of the distribution of grades at the junior college is suggested. Through such a process, tendencies toward both lenient and severe grading may be detected. Comparison of student success at several senior colleges and universities gives counselors val-

uable clues to advising students in selecting a college to which they can transfer with expectation of success.

Often an analysis of student records will reveal errors in evaluating transfer credit by the university. The most serious result of such errors occurs when a student is required by the four-year college to repeat a course already completed at the junior college. The reasons for such action must be determined so the junior college may take steps to prevent recurrence of such action.

Reasons will vary, of course, but when a course must be repeated, there is obviously need for better articulation between the two-year and four-year colleges. Nothing is more damaging to the reputation of the junior college than to have its credits refused by the four-year institutions.

To expedite communication and to bring about better understanding of mutual problems of course equivalence it is advisable to assign responsibility for relations with other educational institutions to a specific person or office of the junior college. Usually an administrative staff member with a broad orientation to college policy and philosophy would be assigned to this function. By centralizing this responsibility in one office, or in one person, continuity can be maintained, and errors can be more readily corrected.

The Interview

Junior college representatives will be welcomed at senior colleges as they prepare to interview former students and, in fact, the four-year institutions will usually assist in expediting the process. Through contact with his counterpart at the four-year institution, either by mail or telephone, the junior college representative can make necessary arrangements for interviews. Care should be taken to avoid holidays and examination periods when scheduling visits and interviews.

Usually the four-year college will arrange for the place of interview, the schedule, and the notification of students, though sometimes the junior college representative may be asked to make contacts with former students directly. The junior college agent should plan to make himself available throughout the day of his visit so students will have opportunity to meet with him at their convenience.

Sufficient time should be given the four-year college to make the necessary preparation for the visit by the junior college representative. Remembering that this service is a courtesy, junior college representatives should not cause unnecessary inconveniences by thoughtless requests.

Through the interviews, students are able to furnish many insights into the effectiveness of the junior college. Naturally, their observations and comments should be carefully evaluated in terms of the students' reliability, previous records at the junior college, and their opportunity to have observed firsthand the situation upon which they are commenting. Allowances must be made for a certain amount of subjectivity. Because instructors do not influence all students similarly, comments about instructors must be carefully considered before any valid judgment can be deduced. In research of this type, it is safe to presume that, in most instances, students are well-intentioned and are trying to be objective about their evaluations.

In order to get best results from interviews, it is advisable to acquaint the students with this service while they are still attending junior college. It should be pointed out that follow-up studies are evidence of the continuing interest of the college in the welfare of the student, and that they provide an excellent opportunity for the student to make a significant contribution to the junior college.

The junior college representative who is to conduct the interviews must make advance preparation by studying student records—both before and after transfer—and by compiling grade-point differentials, program changes, and other information which familiarize him with the student's relative success at the two institutions. Grades taken from the official records of the college are far more reliable than grades estimated by the student.

An important advantage of the follow-up interview is that it provides opportunity for the counselor to aid the student quickly, when need for aid is perceived. Homesick students, those who are not achieving as well as they did in junior college, and those who have personal problems, many times turn to the junior college for assistance. They may not always overtly seek help with personal problems but the skilled interviewer can discern difficulties and offer assistance. If

possible, the same students should be interviewed twice during their careers at the four-year colleges. Increased maturity and insight may cause some to alter original conclusions about the overall effectiveness of the junior college program.

The Questionnaire

Questionnaires employed to gather information about transfer students are used in connection with interviews or as a substitute means of collecting data. When used in conjunction with the interview, the questionnaire helps the interviewer to include salient points in the discussion. The advantage of the questionnaire for widely dispersed graduates is obvious.

Although questions selected for inclusion in the questionnaire will vary, the first section of the questionnaire will probably include questions such as the following:

1. Student—name, age, sex
2. College to which he transferred
3. Date of transfer
4. Number of semesters completed at the junior college
5. Field of study pursued at the junior college
6. Major presently being studied at the four-year college
7. Date of the interview and the number of semesters completed at the four-year college
8. Grade-point average at the junior college
9. Grade-point average at the four-year college.

The second section of the questionnaire in most cases is concerned with the process of admission to the four-year college. Problems of articulation with regard to acceptance of courses by the four-year college usually emerge from such questions as: "Were all of your transfer courses accepted by the four-year college?" "Which courses were not accepted?" The responses to these questions give the interviewer the opportunity to perceive articulation problems, and in some cases, the opportunity, while he is still on campus, to have the four-year college rectify evaluation mistakes if any exist. This is one of the most important sections of the interview for the student because, if a mistake has been made in the process of evaluation, the junior college repre-

sentative can ask the admissions dean to take corrective action with reasonable expectation of success.

The third section of the questionnaire, relating to instruction, may concern itself with the following:

1. Adequacy of the junior college curriculum
2. Student's evaluation of instruction in the junior college
3. Competency of junior college instructors with regard to experience and preparation
4. Comparison of grading systems used at the junior college and the four-year college
5. Availability and willingness of the junior college instructors to give assistance to students
6. Comparison of study assignments at the junior college with those at the four-year college
7. Difficulties encountered by the student in the transition to the four-year college, and advice on how these difficulties could be reduced or eliminated for future students.

A fourth section of the questionnaire should concern itself with the student personnel services provided by the junior college. The following information may be requested:

1. The student's opinion as to the adequacy of educational counseling. The interviewer will be concerned with the student's evaluation of the ability of the counselor to give proper advice about the curriculums of the four-year college.
2. The student's opinion on the adequacy of personal counseling. Was it available when the student needed it and was the counselor willing and able to give the kind of help the student sought? Was there a system of referral if specialized assistance was required?
3. The student's opinion as to the amount and quality of assistance provided in vocational planning. Was specialized testing used to assist the student in discovering abilities and interests?
4. The student's opinion of the value of the extracurricular program. Was the program sufficiently extensive? How general was the student's participation? Did it provide sufficient opportunity for leadership? How did it compare with opportunity at the four-year college?
5. The adequacy of the placement services. Did the student require

part-time employment while in college? Was the placement office effective in helping him obtain it?

A final section of the questionnaire is frequently used for the purpose of eliciting general impressions of the entire junior college program. Junior college interviews often ask the student to compare the instruction at the junior college with that of the four-year college, soliciting the process recommendations for strengthening junior college instruction.

The organization of the questionnaire and the subjects suggested here are, at best, rough guides as to the type of information follow-up studies of transfer students may seek. Naturally, the committee which establishes the philosophy and objectives of the study may design the questionnaire to achieve these objectives. Each time a follow-up study is conducted the questionnaire should be revised in accordance with changed objectives or observed imperfections, particularly when there are questions which yielded ambiguous answers. Moreover, questionnaires should be brief and planned in such a way that responses can be tabulated quickly and efficiently. (A comprehensive form aimed at eliciting brief answers may be found in Form 1, pp. 54-57, and Form 2, pp. 57-58.)

Annual Reports from Senior Colleges

In addition to the data derived from the interviews and questionnaires, another rich source of information is that found frequently in reports regularly furnished by the four-year colleges. There is an increasing trend for senior colleges to send to the junior colleges grade reports on individual students, as well as statistical data comparing the grade-point average of the junior college students with the native students. Some universities send annually to junior colleges statistical summaries of the work of junior college transfers along with their transcripts.

Systematically prepared reports of this type make possible comparisons of the performances of junior college students with native students in the university. This is a particularly valuable service because relatively few junior colleges systematically collect follow-up data on transfer students from the time of their transfer to the time they receive their bachelor's degree. The advantages of complete and unin-

terrupted data are obvious. It is to be hoped that increased use of data processing equipment will make such reports and studies routine and widespread.

Reporting Transfer Follow-Up Studies

When the final analyses of the record, the interviews, and/or the questionnaires are made, the findings should be reported to the administration and faculty. Custom seems to indicate that written reports, complete with statistical data, be submitted routinely to the administration. Some colleges prepare additional reports for the faculty which may be written or may be presented orally at a general faculty meeting or in departmental meetings. It should be kept in mind that lengthy statistical reports frequently do not inspire action, yet they are valuable for later comparisons.

Whether the report is oral or written, the person who conducted the study should interpret the results in the light of his experience and make comparisons which will be meaningful. In most cases, the faculty who teach transfer subjects will center their interest on grade-point differentials, the students' opinions and attitudes toward their teaching, and how well junior college preparation correlated with preparation provided at the four-year college. Quotes from the students concerning their impressions of the junior college in general and their attitudes toward the value of junior college education are appreciated by the faculty. Student remarks about individual instructors or counselors, of either complimentary or uncomplimentary nature, should be reserved for private dissemination.

Many of the four-year colleges can benefit from comments that transfer students make concerning their programs and many of the colleges request copies of the report. As a courtesy and a mark of appreciation for the extra work involved in arranging follow-up interviews, it is good practice to forward any information which would be of help to the four-year college in its self-evaluation.

FOLLOW-UP STUDIES OF TECHNICAL-OCCUPATIONAL STUDENTS

One of the most vital, frequently neglected, and yet highly important areas of follow-up studies is that of students in technical-occupational

curriculums. These studies are more difficult than studies of transfer students for the following reasons:

1. Technical-occupational students quickly disperse; they are difficult to find.

2. Because of the dispersion of students, greater reliance must be put on the questionnaire as a source of information; interviews are difficult and time-consuming except in certain employment concentrations.

3. Not all students who become employed after they leave junior college were enrolled in technical-occupational curriculums in the junior college.

4. Caution must be exercised to separate the dropouts from the occupationally prepared students.

5. Standards of acceptable employment performance vary widely in business and industry.

6. Response from occupational students, especially when the questionnaire is the only means to reach them, is frequently low.

There are, of course, exceptions to these generalizations. Many groups of students with occupational majors are quite uniform in their preparation, are employed in well-defined positions, and respond willingly to any assistance requested.

Focal Points of the Process

To provide a meaningful base upon which to evaluate the findings from follow-up studies, related follow-up studies of technical-occupational studies should include the following elements of student supply, occupational opportunities, and employment needs:

1. Study of the educational programs and interests of graduating high school seniors in the junior college districts

2. Study of manpower needs and supply prepared by federal, state, and local agencies

3. Surveys of manpower needs of the entire community and its environs to determine the types of industry and business that could employ junior college graduates

4. Surveys of industries and businesses to determine educational preparation required currently and in the future

5. Surveys of supervisors in business and industrial fields to determine the specific knowledge, skill, and abilities required in the occupations they represent

6. Continuing study of the students who are presently enrolled in junior college as to their majors and indicated interests, and the relationship of these programs to employment opportunity

7. Study of former students, both graduates and non-graduates, of the technical-occupational curriculum to determine their place of employment, and to secure their impressions of their junior college preparation

8. Analysis of the junior college placement records to determine the categories of employment of students, and the relationship of this employment to previous preparation

9. Surveys of employer reaction to student preparation for employment.

In establishing the framework for follow-up studies of technical-occupational students, the junior college is primarily concerned with two major problems. The first centers around concern as to whether the college is actually serving the community through its various curriculums. The second revolves around the question as to the adequacy of student preparation in these programs. The joint committee of faculty and administration directing follow-up research should decide the methods to be used to obtain an answer to these questions.

Community Needs

At an early stage in planning a follow-up study of technical-occupational students the several occupational advisory committees which serve the college should be consulted. Because members of these committees represent various community interests, their counsel and assistance will be helpful in designing the study, in securing support of the business community, in interpreting its findings, and in implementing its recommendations. Failure to use advisory committees would indeed represent poor public relations.

As a starting point, the objectives of the technical-occupational program should be reassessed in the light of any changes in the community's development. If the community is not changing in its indus-

trial and business structure, and if the characteristics of the population have remained stable for some time, the curriculums may be meeting business and industrial needs. If there has been substantial community change, new objectives may need to be developed. Decisions about procedures to identify changes and to adapt the study to these changes should be a major initial consideration.

When a junior college is first established, much time and effort is spent in ascertaining the characteristics of the community in which it is located. Studies and surveys are originated and analyzed to determine occupational curriculums which are appropriate. As time goes on, there is a tendency to assume that the original selection of majors and subjects is still representative of local manpower demands. This assumption may be realistic in some communities, but it is unlikely in a majority of the country's cities and towns, for changing technology can alter the structure of a community in a very short time. Impressions as to adequacy of curriculums are not enough. They must be validated by continual research.

In ascertaining the effectiveness of technical-occupational curriculums, the following questions are frequently asked:

1. Is the college offering types and varieties of curriculums truly representative of the social, economic, and industrial life of the community it is serving?

2. By what means does the college check its objectives with its performance in this respect?

3. If advisory committees are used to guide the college in keeping curriculums current and representative of the needs of the community, how effective are they?

Community surveys are usually used to obtain data required to evaluate the appropriateness of occupational curriculums. Despite their expense, there has been an increase in their use during past years—local, state, and national. Federal funds are available to conduct area occupational studies which are aimed at determining need for and opportunity in new occupations. Foundation grants have been given to some private junior colleges for this purpose.

Research is being conducted in increasing amounts by federal and state agencies in order to keep information about changing occupational opportunities current. This information is available on request, and continuous study of these data is essential for any college operating technical-occupational programs.

Effectiveness of Curriculum

The second major problem to be solved by follow-up studies of technical-occupational students centers around how well the students are prepared for their employment. Follow-up research would be concerned with these questions:

1. Are the students receiving an education which permits them to move into their occupational endeavors with competence and assurance?

2. Are the students well-received by their employers as evidenced by a higher rate of pay and rapid promotion?

3. What are the students' opinions and attitudes toward the type of education they received in college?

4. Is the placement office supplying adequate numbers of skilled recruits for business and industry in the community?

Procedures

Usually, appraisal of student success in employment is accomplished through direct contact with students and employers. The survey may be organized to cover a single occupation, several occupations in a single field, or to cover all the fields in which the college provides occupational studies. The college must decide the number of graduating classes the survey should cover, and in what depth the information will be gathered.

When the scope of the survey is determined, initial contact is made with the employers who will participate in the study. Decisions must be made early as to the information that will be gathered by phone, by questionnaire, and by visits and interviews, and as to who will gather the data. While costly, a professional staff may get results that are better than those obtained with volunteer help.

Colleges planning their first occupational follow-up study should seek the assistance of a consultant. Small-scale studies done frequently are often more helpful than studies of larger scope done with long lapses of time between them. Experiences of other colleges could also be helpful and reports of other colleges which have conducted occupational follow-up studies should be thoroughly studied. The project director should be a person with experience in survey techniques, and one who is fully acquainted with the field under study. Employers respond favorably to contacts made by competent staff.

While surveys vary, information generally sought will include:

1. Number of junior college graduates employed
2. Other sources of employees in this field
3. Specific aspects of the preparation of the employees deemed essential
4. Specific weakness of employee preparation
5. Records of employee promotions.

For the data to be of maximum value in an occupational follow-up study, information must be gathered about *each* student. Only when the individual employee's employment record is compared with his collegiate preparation is the information diagnostically significant. Group data hide many important clues.

On the other hand, group data must be compiled. In this connection a meaningful summary is difficult because terminology for comparable tasks often differ. This difficulty can be minimized by selecting competent survey personnel, by validating questionnaire replies, and by providing built-in safeguards in the data collecting process.

The ideal to be sought is probably a routine follow-up of each student placed by the college. (See Pasadena City College form, Appendix, p. 67.) Systematic analysis of information gathered provides the college with reasonably reliable data and provides continuing opportunity to correct faulty data collecting techniques. Furthermore, periodic analysis of such data will distinguish genuine trends from temporary fluctuations.

It should be noted that surveys of a limited number of employers will provide data about only a small proportion of the occupational

graduates. When the employer survey is combined with follow-up of each graduate, the information obtained is much more reliable. Though widely dispersed as most students are, most of them can be located, and when approached properly, their responses are as valuable as the responses of employers. From the students the college usually seeks the following information:

1. Dates enrolled in the college
2. Major in college
3. Present job; is it related to the student's major field of college experience?
4. Job sequence since leaving college
5. Aspects of college preparation which have proved helpful in obtaining initial employment and in gaining promotions
6. Deficiencies in college preparation
7. Additional education obtained since graduation
8. Evaluation of instruction
9. Evaluation of advisement and counseling
10. Advice to other students planning employment.

Because of the difficulty in keeping abreast of the constant change in technological fields, a combination of several methods of follow-up is advisable. Complete reliance on one method only is not adequate to assure a comprehensive picture of the community occupational requirements, and of the success of students in a variety of employment situations.

Placement Services

A very important phase of the technical-occupational follow-up study is that of evaluating the effectiveness of the placement service of the college. This service is one of the most important of all the student personnel services. In many colleges, the placement office is the lifeline between the college and the community which it serves. Through his many contacts, the placement officer keeps his finger on the business and industrial pulse of the college community and he is alert to employment opportunities for students on campus. Often he is the person responsible for conducting follow-up studies, and his office becomes the repository for the data received from such studies.

Any evaluation of the effectiveness of placement services should be undertaken from the viewpoint that placement is vocational guidance in action. Actually, while much vocational counseling is given by all counselors and by some instructors, the placement officer is best equipped to provide this service. The placement director and his staff should be considered essential members of the counseling and guidance team.

The following general guidelines are suggested for evaluating the effectiveness of placement services:

1. Is the placement office supplementing general counseling by offering vocational advice?
2. Are vocational materials and information current?
3. Are vocational tests administered by the placement office, or, if not, are results readily available to this office?
4. Does the placement officer communicate trends in new or unusual job classifications to the curriculum office so that appropriate educational programs may be initiated?
5. Does the placement office attempt to locate part-time positions for students?
6. Does the placement office report occupations which seem to be diminishing in numbers and importance?
7. Does the placement officer conduct an exit interview of dropouts, attempt to find them positions, and encourage them to continue their education?
8. What success has the placement office had in securing full-time employment of graduates?
9. Does the placement office have sufficient clerical help to process applications for employment by students, and requests for applicants by employers?
10. Is on-campus placement activity channeled through the placement office?
11. Do the deans or chairmen of the technical-occupational areas cooperate with the placement counselor in matters of placement and placement reports?
12. Are adequate placement records maintained?
13. Is there an effective system for maintaining off-campus contacts with prospective employers?

14. Does the placement officer make monthly reports which indicate the number of positions filled and the number of requests for student employment by prospective employees?

15. Does the placement officer maintain effective liaison with federal and state employment agencies so that notices of position vacancies can be posted?

DROPOUTS AND WITHDRAWALS

Junior colleges, like other educational institutions, take great pride in annual graduation ceremonies which offer tangible evidence of success, both of the student and of the instructor. While this feeling of pride is justified, it should be tempered with the recognition that an element of failure is present in every college. This failure is represented by the alarming number of students who enter college but who fail to complete a program of studies.

The trends vary, but generally follow one of these patterns:

1. Students, called "no shows," who register and complete the entire admissions process but fail to appear on the opening day of class

2. Students who drop out of college sometime during the semester without any explanation, thus becoming unofficial withdrawals

3. Students who withdraw with proper notice during the semester

4. Students who end their education before completing the junior college degree program. (Such withdrawals, of course, may not necessarily reflect failure on the part of the junior college because the students may have planned a short-range program of studies.)

Follow-up studies are concerned with determining the number of dropouts and withdrawals, attempting to determine the characteristics of such students, and taking the proper steps to reduce their number.

It is relatively easy to determine the number of "no shows." After the close of registration, the admissions office and the registrar are able to collect and count the uncalled for program cards. If a follow-up study of these students is to be initiated, there is a ready-made list of names and addresses which can be used as a basis for the study. It is usually true that this group, above all others, will yield the poorest returns on questionnaires.

It may be possible to reduce the number of "no show" students by charging registration fees but research has shown that a student may make preliminary application to more than one college in order to increase his chances of being admitted. And this practice may increase as a result of the increase in number of students seeking college education. This practice is, of course, unnecessary at public community colleges with open door admissions policies. A large proportion of the students who make multiple applications have marginal scholastic records.

The student who drops out of school sometime during the semester without any explanation, the "unofficial withdrawal," presents a different problem. Since he has not completed a terminal interview, it is difficult to trace his whereabouts or to identify his true reasons for leaving college.

The person who officially withdraws gives the college an opportunity to counsel with him, to determine the reasons for his withdrawal, and perhaps to assist him in finding employment. Many junior colleges have adopted the policy of requiring a withdrawal interview for each student who terminates during a semester. The statistics gathered from these interviews are a source of great interest, not only to the college concerned, but to all state educational agencies.

Follow-up studies of dropouts usually seek answers to the following:

1. Personal-social background of the student (sex, marital status, education of parents, income of parents, standards of housing, ethnic origin of students)

2. Academic potential and performance aptitude test scores, grade-point average, transfer or technical-occupational student, previous college experience

3. Probable causes of withdrawal (during what semester, reason given).

The college usually has considerable information about students before they become dropouts. But after students drop from college, they frequently are difficult to contact and rarely contribute much to further interpretation of causes leading to their withdrawal. Consequently, little has been learned from studies of student withdrawals, which will help to reduce this number.

Research has shown little correlation between student characteristics and dropouts. Matson,[1] after exploring the characteristics of two hundred and seventeen students who withdrew from public junior colleges, found, after comparing these students with others who remained in school, that there was very little difference in the two groups with regard to sex, marital status, veteran status, high school attended, socioeconomic status, academic aptitude, or grade-point average. One conclusion she reached from her study is the possibility that the student who withdraws lacks a sense of belonging or identification with the college.

More recent research indicates an interesting avenue to the identification of potential dropouts by measurement of attitudes. Roleder,[2] using a projective technique of personality assessment directed toward five attitude areas representative of the college student's background, experienced measurable success in predicting the type of student attitude which could forecast the dropout. He selected the following five attitude areas as determiners for dropouts:

1. Motivation
2. Collegiate culture
3. Levels of aspiration
4. Family relationships
5. Socioeconomic status

Although further research is indicated, the scale used in this experiment labeled correctly 81 per cent of the dropout group and 73 per cent of those in the group who remained in college. Additional studies of this type seem most desirable. Once it is possible to recognize in advance types of students who are apt to withdraw, research may then be undertaken to ascertain counseling approaches that will be most effective in holding these people in college and in helping them to achieve their goals.

The students who withdraw after completing a semester or two

[1] Matson, Jane E. *Characteristics of Students Who Withdraw from a Public Junior College,* (Unpublished doctoral dissertation, Stanford University, 1955).

[2] Roleder, George T. *College Attitude Measurement by Direction of Perception Technique,* (Unpublished master's thesis, Claremont Graduate School, 1958).

sometimes provide interesting cases for research. Investigation usually reveals that many who withdraw are dissatisfied with the college in some way. Students who withdraw at the close of any semester before they graduate do not have an exit interview. Therefore, their reasons for leaving and their attitudes toward the junior college must be explored by follow-up questionnaires or personal interviews. If it is found that a significant number of these people are transferring to other colleges, it is important to determine why this is happening. Dissatisfaction with instruction, with curriculums, or with student personnel services should be investigated and corrective action taken when necessary. (See Valley College forms in Appendix, pp. 59-60.)

It can be anticipated that many students who have accepted employment before graduation will continue their education in the evening program of the college. They should be included in all general follow-up studies to determine their reasons for leaving, their attitude toward the college, and their impressions as to how much they are benefiting on the job from the education they have received at the junior college. Certainly, the college should manifest a continuing interest in their well-being.

Future follow-up studies of students who withdraw must become much more incisive and analytical before we can predict with certainty the potential dropout or assess efforts to reduce the rate of dropouts. This is a field which needs more research.

Part III

USING FOLLOW-UP STUDIES

Implicit throughout this bulletin is the assumption that the information derived from follow-up studies will provide a basis for future action in various phases of college operations. This assumption is based on the belief that follow-up studies, as a type of institutional research, are directed toward the improvement of college services. When research data indicate a need for corrective action such action should be taken. Follow-up studies are not, and should not be, undertaken merely to compile records. Their ultimate objective is to gain information which will enable educators to do a better job.

In order to convert the information derived from follow-up studies into action which will bring improvement there must be an attitude shared by both faculty and administration which will encourage objective analysis of the junior college, its purposes, and procedures. There must be wholehearted cooperation both in the process of conducting studies and later in implementing its findings. Therefore, to be effective, all staff must be involved in follow-up studies. There is a trend today among junior colleges to assign administrative assistants to institutional research which includes systematic follow-up studies. While this may be expedient, an efficient means of identifying responsibility for organizing such studies, it is nevertheless true that participation by the entire staff is necessary if the studies are to result in change. Total responsibility should not be vested in one person, particularly one who usually represents administration.

All of the procedures involved in follow-up studies are designed to provide information which will enable the college to better serve its students. Little is to be gained in examining college procedures and

philosophies if the outcome of such effort is not directed toward the person for whom the college exists—the student. If future students are to be benefited, it follows that the methods used in helping them towards the attainment of their goals will also be improved. Follow-up is not, and cannot be, an end in itself. The essential goal of this type of study is a college sensitive and attentive to the needs of its students.

The action phase, which is essential to improvement, begins when the results of follow-up studies are conveyed to the college staff. This step is often a difficult one. Faculty may react adversely to actual or implied criticism. If care has been taken to create the proper atmosphere for the study, this situation should not arise. Naturally, in making known the findings, good judgment and tact should be used to avoid needlessly embarrassing any member of the college staff. On the other hand, an administration which allows the results of a sound study to be placed in some office file, whose contents are consigned to oblivion, shirks its responsibility.

Following the presentation of the report, the administrator should praise outstanding performance, point out inadequacies, and delegate to the appropriate areas the responsibility for corrective action. It would be wise also to establish a schedule for completion of the recommended changes and to call for periodic reports on action taken. It is not sufficient to assume that because deficiencies have been revealed they will automatically be corrected.

It is desirable to transmit results of follow-up studies to groups other than the college faculty. For example, advisory committees should be informed about problems and these committees should consider the solutions which might be appropriately instituted.

Not the least of those to whom the results of follow-up studies should be announced are the general public and future students. If a junior college wishes to be forward looking, progressive, and capable of staying abreast of changing technological and sociological changes, no better method exists than to conduct, implement, and make known results of follow-up studies. The existence of junior colleges depends on their ability to convince the people of their communities that they are dynamic, educational institutions capable of serving students well. Maintenance of standards, excellence in teaching, and a keen desire

to serve effectively the needs of businesses and industries of their communities are the necessary trademarks of junior colleges. Follow-up studies keep the college in tune with these obligations.

The junior college is an institution committed to being responsive to student and social needs. To achieve these aims demands a full measure of effort by those who represent it. When these efforts are directed by the findings of well-designed, follow-up research, there is no better reason to expect that they will succeed in performing the complex tasks which society has given to the junior college.

Appendix

Form 1 Follow-up Survey
OAKLAND CITY COLLEGE—MERRITT CAMPUS
Oakland, California

Name .....
Age upon entering OCC.....
Age upon leaving OCC.....

1. College Attendance
   .....a. For how many semesters were you enrolled at Merritt Campus of Oakland City College? (not including summer sessions)
   .....b. In how many of these semesters were you enrolled in a program of six or fewer units? (not including summer sessions)
   .....c. In how many summer sessions were you enrolled?
2. What has been your one principal field of endeavor since leaving Oakland City College?
   .....a. Further education
   .....b. Full-time employment
   .....c. Armed Forces
   .....d. Housewife
   .....e. Other.....
3. Which category of the following pertains to you?
   .....a. Received A.A. degree at Oakland City College but have not continued education at a four-year college or university.
   .....b. Completed desired course or courses at Oakland City College without receiving A.A. degree but have not continued education at a four-year college or university.
   (If you check a or b, answer Question 4 but not 5.)
   .....c. Withdrew from Oakland City College before completing a course or courses of study and now continuing education at a four-year institution.
   .....d. Withdrew from Oakland City College before completing a course or courses of study and not now continuing education at a four-year institution.
   (If you check c or d, answer Question 5 but not 4.)
   .....e. Received A.A. degree or completed course of study at Oakland City College and now continuing education at four-year college or university.
   (If you check e, skip to Question 7.)
4. If your answer to Question 3 was choice a or b, indicate in the space below the primary reason and secondary reasons for not continuing university or college work.
   (Use the choices listed below and place the letter of the appropriate reason in the space provided here.)
   .....One Main Reason .....Any Other Reason
   a. You could not afford to continue.
   b. You were unable to transfer to a four-year college because of low grade-point average.
   c. You did not feel higher education was meeting your personal needs.
   d. You felt you had an adequate education for work in a particular skill, trade, or area.
   e. You felt that higher education had nothing to offer you.
   f. You secured a full-time position which you preferred to higher education.
   g. You married.
   h. You entered the Armed Forces.
   i. Other.....
5. If your answer to Question 3 was choice c or d, indicate in the space below the primary and the secondary reasons for your withdrawal from OCC.
   (Use the choices listed below and place the letter of the appropriate reason in the space provided here.)
   .....One Main Reason .....Any Other Reason
   a. You had inadequate financial means of support.
   b. You were needed to support your family.
   c. You had no sense of success in college work.
   d. You were excluded because of low grade-point average.
   e. You found through self-analysis that you were unable to do college work.

f. You had personal adjustment problems in the college.
g. You had personal adjustment problems in the home.
h. You were dissatisfied with the attitude of the college and the college staff.
i. You were no longer interested in higher education.
j. You had a new interest in a field or area not offered at OCC.
k. You wanted to obtain full-time employment for economic reasons.
l. You desired to learn a skill or trade not offered at Merritt Campus of OCC.
m. You felt the training you desired at OCC had been completed.
n. You found that the courses you desired were not available.
o. You entered the Armed Forces.
p. You wanted to transfer to another college or university.
q. You married.
r. Other.....

6. If you have not continued with higher education after leaving OCC, do you plan to do so in the future?

.....Yes .....No

7. Did you first begin college because you: (check one only)

.....a. Desired a higher-paying business position through the college diploma?
.....b. Merely wished to learn a skill, a trade, or begin work in a profession?
.....c. Desired a combination of both a and b?
.....d. Were strongly encouraged by parents and/or friends to attend college?
.....e. Were influenced to attend college because your friends were going to college?
.....f. Desired to enter a professional field, i.e., medicine, law, teaching, engineering, etc., which required higher education?
.....g. Were not sure of what you wanted to do after high school graduation?
.....h. Other.....

8. In the following statements, indicate with a check the response which best describes your feeling about your experiences at OCC.

a. College Study
(1) College study was more difficult....., less difficult....., about as difficult....., than/as I expected.
(2) College study in general was more stimulating....., less stimulating....., about as stimulating....., than/as I expected.
(3) There was more help....., less help....., about as much help....., from instructors than/as I expected.
(4) Courses offered and programs available were more....., less....., about as varied....., than/as I expected.

b. Guidance and Counseling
(1) There was more....., less....., about as much....., general help from counselors than/as I expected.
(2) There was more....., less....., about as much....., vocational guidance from counselors than/as I expected.
(3) There was more....., less....., about as much....., time and opportunity to decide on definite vocational or educational goals than/as I expected.
(4) There was more....., less....., about as much....., opportunity for guidance in personal problems than/as I expected.
(5) Other response.....

c. College Activities
(1) There were more....., less....., about as many....., social and student activities than/as I expected.
(2) There was more....., less....., about as much....., time and opportunity for participation in team sports than/as I expected.
(3) There was more....., less....., about as much....., encouragement from the college to participate in social, student, and athletic activities than/as I expected.
(4) I had more....., less....., about as much....., time and opportunity for social and student activities than/as I expected.
(5) Other response.....

9. Did your understanding or awareness of the nature of higher education change either while you were in college or after you had left?

.....Yes .....No

10. If your point of view about college work did change was it because of (check one most important reason):
    .....a. A counselor's help?
    .....b. An instructor's help?
    .....c. Your own self-analysis?
    .....d. Failure in college work?
    .....e. Work experience?
    .....f. Social experiences?
    .....g. Other.....

11. Show in what ways your college experience at OCC was most helpful by indicating in the space below the areas of primary assistance, and the areas of secondary assistance.
    (Use the choices listed below and place the letter of the appropriate item in the space provided here.)
    .....One Main Area of Assistance
    .....Any Other Area of Assistance
    a. You obtained a clearer understanding of your abilities or goals.
    b. You gained a clear understanding of the nature of higher education and the demands it makes upon the individual.
    c. You obtained a clearer understanding of job or professional requirements and opportunities.
    d. You received the training and/or education necessary to get a job in the field of your choice.
    e. You received the encouragement, challenge, and sense of success necessary for you to continue your education.
    f. You learned how to get along with people in your community.
    g. Through a particular course or group of courses, you discovered a new field of interest.
    h. Other.....

12. Show in what ways your experience at OCC could have been more helpful to you by indicating in the space below the areas of primary assistance and the areas of secondary assistance that would have been helpful to you.
    .....One Main Area of Assistance
    .....Any Other Area of Assistance
    a. A closer relationship could exist between students and instructor.
    b. A wider range of potential fields of study could be offered.
    c. More supervision and guidance in classwork could be offered.
    d. There could be more helpful guidance in choice of programs and explanation of courses.
    e. More time could be allowed for student activities.
    f. There could be more integration of student activities into the total college program.
    g. More students could be encouraged by the college to participate in student activities.
    h. Other.....

13. If you are now working full-time, indicate what type of work you are doing.
    .....a. Industry
    .....b. Business
    .....c. Sales
    .....d. Profession
    .....e. Self-employed
    .....f. Other.....

14. If training was required for your present occupation, indicate below the approximate amount of training required and list occupation in the space provided here.
    .....a. Several months or years of academic study.
    .....b. Several months or years of apprentice training leading to journeyman standing.
    .....c. Several months or years of training in general office procedure or secretarial field.
    .....d. Several months or years of training in technical field.
    .....e. Few weeks or months of training for particular occupation.
    .....f. No training other than on-the-job training required.
    OCCUPATIONAL TITLE.....

15. If the work required training or the acquisition of a skill, where did you receive most of this training?
    .....a. OCC Merritt Campus only.
    .....b. OCC Merritt Campus plus upper-division work at another college or university.
    .....c. OCC Laney Campus.
    .....d. Other trade or technical school: (Name).....
    .....e. Apprenticeship program (other than at Laney).
    .....f. Training on the job.

.....g. Business school or college: (Name).....

.....h. Other.....

16. Is your present employment a continuation of a part-time job held in college?

.....Yes .....No

17. Do you plan to make this job your life's work?

.....Yes .....No

18. If not, what are your future plans?

.....a. Further training in your present field of endeavor.

.....b. Further education at a college or university.

.....c. Change of vocation to another area.

.....d. Marriage.

.....e. Other.....

Form 3 Double Post Card Questionnaire
AMERICAN RIVER JUNIOR COLLEGE

Dear Graduate:

Greetings from your alma mater! As a graduate of American River Junior College you have probably reflected a little on your experiences and training here.

We are keenly interested in your views as to how we may have assisted you, and in what ways we might have done better. Your frank reply to the questions on the attached, self-addressed, stamped postcard will be greatly appreciated.

Sincerely,
President and District Superintendent

REPLY POST CARD

1. What is your present occupation? .....
   Please circle the appropriate reply:
2. Does it relate to work done by you at ARJC?
   None A Little Somewhat Very Much

3. Did ARJC prepare you for the future?
   No A Little Somewhat Very Well
4. How much did ARJC counseling help?
   None A Little Somewhat Very Much
5. How would you classify the instruction?
   Unsatisfactory Good Superior
6. Did you benefit from campus activities?
   No A Little Somewhat Very Much

Form 5C Withdrawal From Class
LOS ANGELES VALLEY COLLEGE
Evening Division

In an attempt to provide a more adequate educational program, this form has been developed as part of a research project to study withdrawals from class. It has no personal interest in your individual response. Your answers and reactions will remain confidential. Please answer all items as completely as possible.

Name of class ..... Instructor ..... Date .....

Please complete each item in sentence form.

1. I enrolled in this class because .....

2. What I liked best about this class was .....

3. What I liked least about this class was .....

4. I am dropping this class because .....

Name ..... Sex M ..... F ..... Marital status ..... Married
Age .... Single
High school ..... Graduated Yes..... No ..... Year.....
Veteran Yes ..... No .....
Other college(s) attended ..... Approx. number of units
at other colleges .....
Where are you employed? ..... Nature of work .....
Hours of work per week ..... Overtime .....
Do you plan to enroll again at Valley College at some later date? Yes ..... No .....
Do you plan to attend a four-year college or university? Yes ..... No ..... Major .....
How many miles is Valley College from your home? Under 5 ..... 5 to 9 ..... Over 10.....
Do you live with: family ..... relatives .....friend ..... spouse ..... alone .....
Have you ever withdrawn from college classes before? Yes ..... No ..... How many? .....
Have you used the counseling services at Valley College?

Yes ..... No ..... a. Personal counseling, other than registration.
Yes ..... No ..... b. Testing program (aptitude tests, interest inventory achievement test).

Form 6A Follow-up Questionnaire for Transfer Students
LOS ANGELES VALLEY COLLEGE

Name ..... Date .....
Last First

Our records indicate that you transferred from Valley College and enrolled at another institution of higher learning.

It is essential to evaluate the effectiveness of our academic program in relation to those of other colleges. For that reason we welcome your comments, and would appreciate receiving the completed questionnaire within the next ten days. A self-addressed stamped envelope is enclosed for your convenience.

1. Did you experience any difficulties in adjusting to the four-year college?
   Yes ..... No ..... If yes, explain .....
2. Was your grade-point average at the four-year college higher or lower than at Valley College?
   Explain .....
3. Does the native student, (i.e. four-year college freshman) have any advantages over the transfer student? Yes ..... No .....
   If yes, explain .....
4. If you withdrew from the four-year college,
   a. What were your main reasons? .....

.....

15. Have you needed help while attending C.O.S. in obtaining information about scholarships or loans?
Yes ..... No .....
If yes, did you get help in school? Yes ..... No .....
If yes, write the name of the person or persons in school (not students) who helped you.....
.....

16. In the space below, feel free to make any comments on the way you feel about the counselors and the counseling program or anything about this questionnaire.

PART II

DIRECTIONS: Below are several items concerning attributes of counselors. Each item contains several alternatives. Put an (X) in front of the alternative which comes closest to describing your feeling. Check **only one** response for each item.

IMPORTANT: The word counselors as used below refers **solely** to the deans and counselors at C.O.S.

1. In basic philosophy and outlook on life, the counselors
   ..... are always optimistic.
   ..... tend to see the brighter side of life.
   ..... are sometimes optimistic and sometimes pessimistic.
   ..... are usually sour and pessimistic.
2. The understanding that counselors have of the social and economic forces prevalent in our society today is
   ..... very limited and inaccurate.
   ..... vague and somewhat unrealistic.
   ..... usually adequate and realistic.
   ..... very extensive and realistic.
3. The knowledge and understanding that counselors have of the world of work is
   ..... quite limited.
   ..... about average.
   ..... somewhat better than average.
   ..... excellent.
4. How do you feel about the counselors' ability to understand and help students who differ from themselves in background, race, religion, social, or economic status?
   ..... They have an excellent understanding of background differences.
   ..... They have some understanding of students different from themselves.
   ..... They have little or no understanding of background differences.
5. How much interest do counselors show in their job of counseling with students?
   ..... They definitely lack interest.
   ..... They do not show their interest.
   ..... They seem to be interested.
   ..... They have a great deal of interest.
6. Counselors are
   ..... lacking in emotional adjustment.
   ..... like most people in their emotional adjustment.
   ..... very stable and well-adjusted emotionally.
7. In trying to see the student's point of view, counselors
   ..... are very tolerant.
   ..... try to be fair-minded.
   ..... are sometimes overbearing and talk down to students.
   ..... usually force their pet ideas on students.
8. The training and experience of the counselors enable them to handle
   ..... all kinds of student problems.
   ..... only certain kinds of student problems.
   ..... no student problems.
9. How well do counselors help students achieve a clear-cut and realistic understanding of themselves and their problems?
   ..... very well.
   ..... fairly well.
   ..... not very well.
   ..... not well at all.
10. The counselor's interpretation of psychological tests to students is
    ..... always clear and very understandable.
    ..... usually clear and understandable.
    ..... too general to be of much help.
    ..... confusing and of no help.
11. The amount of time that counselors spend in talking about tests and test scores is
    ..... much greater than it ought to be.
    ..... somewhat excessive.

..... about right.
..... much less than it ought to be.
..... somewhat less than it ought to be.

12. How do counselors deal with the student's problems?
..... They usually dictate the solutions.
..... They are likely to give solutions to problems.
..... More often than not they present students with alternatives.
..... They always offer alternatives from which the student may choose.

13. In helping students with their personal and emotional problems, the counselors are
..... of great help.
..... of some help.
..... practically of no help.
..... do more harm than good.

14. The understanding that counselors have of classroom conditions, problems, and student-teacher relationships is
..... clear and realistic.
..... adequate.
..... lacking and confused.

15. The information possessed by counselors concerning requirements of the various departments of C.O.S. is
..... very limited and inaccurate.
..... somewhat limited and varying in accuracy.
..... usually comprehensive and quite accurate.
..... always comprehensive and accurate.

16. In assisting non-transfer students in selecting a field in which to major, counselors
..... are of great help.
..... are of some help.
..... are practically of no help.
..... do more harm than good.

17. How do you feel about the amount of time given for interviews by the counselors?
..... Interview is quick, impersonal, and rushed.
..... Interview feels somewhat hurried.
..... Interview time is reasonable.
..... Length of interview is set by the student.

18. When advising students in course selection, the counselors
..... disregard student wishes.
..... try to dissuade students from their choices.
..... sometimes allow students to make their own choices.
..... allow students complete freedom in making their choices.

*TECHNICAL EDUCATION; CURRICULUM; *CURRICULUM DEVELOPMENT; *PROGRAM PLANNING; PROGRAM EVALUATION; MANPOWER NEEDS; *JUNIOR COLLEGES; EDUCATIONAL NEEDS; ADMISSION CRITERIA

The purpose of this booklet is to provide guidelines and advice for establishing technical education programs in 2-year colleges and creating better public understanding of changing national manpower needs and the directions which education must take to meet them. "Introduction and Rationale" covers the purposes of the bulletin, new directions in higher education, and societal and technological trends. "College Level Occupational Education" discusses the manpower needs and the rewards of 2 years of college study. "The Spectrum of Middle Level Manpower" discusses the role of the technician in industry, health fields, business, agriculture, and other semi-professional occupations. "Planning Educational Programs" assesses the need and capability, steps in curriculum planning, and the evaluation of the technical education program. "Concept and Practice in Curriculum Development" gives (1) definitions and levels, (2) technologies related to engineering and industry, (3) a core curriculum in technical education, (4) semi-professional curriculums such as health, business, and agriculture, and (5) three instructional innovations. "Recruitment, Selection, Guidance and Placement" and "Sources of Assistance and Information" are concluding chapters. (PA)

TECHNICAL EDUCATION IN THE JUNIOR COLLEGE

NEW PROGRAMS FOR NEW JOBS

by NORMAN C. HARRIS

AND

METALLURGICAL TECHNICIANS

Interesting positions are available at AMF for experienced laboratory technicians. Knowledge of materials research including electro-plating, high temperature alloys, metallic coating or metallographic processes is required.

This is an opportunity to gain valuable experience while working with extremely well qualified engineers and scientists in a professional environment.

Excellent salary and very liberal employe benefits are offered.

PARITYPIST

This is an excellent opportunity to join the staff of our editorial department. Those who qualify will enjoy ideal working conditions in our new modern research center in McLean, Va.

MEDICAL TECHNICIAN
Work in physicians ofc. downtown Exp. required. 2-girl ofc. Sal based on experience. 298-8257.

ELECTRONIC ENGINEERS and Technicians

Rapid growth openings in our expanding advanced research and development laboratory. Engineers, Jr. Engineers, Technicians, and Wiremen positions require imaginative individuals with advanced training and experience in the following areas:

MICROWAVE DEVICES AND SYSTEMS

---

air-conditioned office. 5-day wk. Salary open. Unique profit-sharing plan in addition to generous fringe benefits.

DESIGN DRAFTSMAN

R&D laboratory specializing in the Life Sciences needs a Design Draftsman with 2-4 years experience. Position involves drawing of assemblies, subassemblies, and details for biological research instrumentation. 40-hour week, employee benefits, including profit-sharing; salary commensurate with education and experience.

CHEMIST FOR Instrumental Analysis

Immediate opening for young man to work with established senior scientist in the field of polymers involving modification of polymer systems, stability kinetics and

FOREWORD

This booklet was planned and developed as a project of the Curriculum Commission of the American Association of Junior Colleges. Its publication is a part of the Association's program to provide new resources for and fresh insight into the comprehensive approaches of the nation's junior colleges in training and educating both adults and youth. *Technical Education in the Junior College* aims at providing guidelines and advice on the establishment of technical education programs in two-year colleges and creating better public understanding of changing national manpower needs and the directions which education must take to meet them.

The author, Norman C. Harris, is a nationally recognized consultant in the field of technical education, particularly as applied to junior colleges. He is Professor of Technical Education at The University of Michigan, and author of numerous texts and articles in his field.

Publication of the booklet is supported in part by a grant from the Alfred P. Sloan Foundation. The booklet was developed with assistance from a national advisory committee.

NEW PROGRAMS FOR NEW JOBS

by NORMAN C. HARRIS

SECTION I

Introduction and Rationale

Purposes of the Bulletin

- To bring into sharp focus the issues in American society which demand new directions in higher education.
- To highlight the role of the junior college in providing diversity in higher education.
- To acquaint high school students and their parents; high school counselors and teachers; industrial and business leaders; and the public generally, with the potential of the junior college for occupational education.
- To clarify the occupational structure in America and suggest patterns of higher education which will bridge the gap between men and jobs.
- To examine the spectrum of "middle level manpower"—the semiprofessional occupations—and place these occupations in proper perspective within the total manpower picture in America.
- To suggest guidelines for long-range planning of occupational education programs in junior colleges.
- To present some specific examples of junior college curriculum development and program operation which have proved successful.
- To recommend procedures for (1) curriculum construction and program evaluation; (2) selection and retention of students; (3) counseling, placement, and follow-up of students; and (4) establishment of liaison with business and industry.
- To suggest patterns of organization and administration which can make technical education programs more effective.
- To make available a list of sources of assistance and information for junior college faculties planning technical education programs.

NEW DIRECTIONS IN HIGHER EDUCATION

When the horse was king of the highway and Dalton's atom was indivisible, when America was a young country with a geographic frontier to win, when brawn and brain were of equal importance to the nation, "going to college" acquired certain connotations which, though applicable then, are not always applicable today. Here are some of them:

- A college is a community of scholars.
- College is only for the intellectually gifted.
- Higher education should concern itself only with the liberal arts.
- Only the wealthy can send their sons to college.
- Only those whose goal is the professions need a college education.
- A common school education is good enough for most people.
- All you need to get ahead are common sense, hard work, and a little luck.

In the Victorian era, American education was organized at two levels—the public common school and its three R's for the majority; and higher education, usually private, in the academic tradition for the intellectually and financially able. The private academies and preparatory schools bridged the gap between the two. Perhaps five percent of Americans "worked" in the realm of ideas, while the other ninety-five per cent worked.

VICTORIAN STYLE EDUCATION was suited to the nineteenth century and spilled over into the twentieth century, perpetuating a bi-polar society a little while longer in the waning day of the horse and the little round atom.

But Everything Else Has Changed

- Sixty-thousand thundering horses now thrust our jet planes across the sky.
- Dalton's atom has not only been divided—its fission energy holds great promise for a future which its fusion energy threatens to destroy.
- Geographic frontiers no longer exist, but social, political, technological, and economic frontiers beckon with all the lure and all the dangers of the great western migration.
- Space frontiers confront us with problems that require no brawn—all brain.

- A rural society and a pastoral economy have been replaced, in two generations, by an urban society and an industrial economy.
- An America with a predominantly western European culture finds itself a leading power in a family of nations of widely differing cultures.
- A society formerly characterized by a small elite group and a large mass group has evolved into one whose dominant features are a large middle class and a continuous mobility among classes.
- A population of 63,000,000 in the United States in 1890 has increased to one of nearly 200,000,000.
- The new technology demands education and training for all young people in order that they may meet the challenge of an increasingly complex world of work.
- An economy of scarcity in a world of scarcity has become one of abundance in a world of scarcity.
- The freedom of man, perceived by the framers of the Magna Carta and eloquently expressed in the documents establishing this nation, is threatened by pressures from within and by challenges from without.

And Higher Education, Too, Is Changing

There is increasing realization that higher education must and will become a dynamic force for the over-all improvement of society. If we look upon youth as the promise of the future—if we believe, with Epictetus of old, that "only the educated are free," if we are determined that our free society shall endure and in turn assist other peoples in their drive for freedom—then our system of higher education will have to be re-cast in a form and substance which will assure the realization of these ideals.

There is evidence that appropriate changes are already under way. The growth of systems of state colleges; the diversification of offerings of the major universities along with the establishment of branch campuses; and the increasing enrollments in technical institutes and business colleges are all healthy signs that higher education is being extended to vastly increased numbers of young people. And the almost fantastic development of the junior college over the past two decades is pointing the way toward a real democratization of higher education.

The Development of the Junior College

Nearly 425 public junior colleges now are operating, and new ones are starting at the rate of 20 to 25 per year. Perhaps the most phenomenal development in recent years is in Florida, where 22 junior colleges were planned, built, staffed, and put into operation between 1957 and 1962. California already had 64 in 1957 and now has 76. New York has a rapidly growing system of community colleges. Significant new developments are occurring in the Midwest. State after state is passing enabling and funding legislation for community colleges. It is probably quite conservative to forecast 600 public junior colleges by 1970, enrolling 1.5 million students. Private junior colleges, too, are moving toward greater comprehensiveness in their educational programs, and their enrollments are increasing yearly.

There are five significant factors about the junior college which identify its role in democratizing higher education:

1. Junior colleges are a force in being, not a dream of the future. They are ready in hundreds of communities to expand educational opportunity.

2. The community junior college typically is located close to the student's home, making access to higher education readily available and relatively inexpensive.
3. Junior colleges already have established liaison with high schools in their attendance areas. Extension of this effort to include occupational information and guidance assistance to high school teachers and students is a relatively easy matter, and many junior colleges already offer such services.
4. The junior college specializes in two-year curriculums, and this length of time is currently optimum for the education and training of most semiprofessional and technical personnel.
5. Community junior colleges know the value of the liberal arts and the humanities in the over-all educational development of young people. Junior college occupational education curriculums typically include courses in English, history, mathematics, science, and economics. These curriculums emphasize *education*, and avoid a narrow concept of "job training."

The community junior college is in a very real sense society's answer to the need for expanded educational opportunity. Millions of high school graduates of "middle level" ability need further education and training to fit them for careers within the spectrum of "middle level manpower"—in semiprofessional and technical jobs. By 1970, one-fourth of the nation's labor force will be employed in semiprofessional and technical jobs which did not even exist in 1930. Some factors which have brought about this shift in the occupational structure are enumerated on the following pages.

SOCIETAL AND TECHNOLOGICAL TRENDS

Society, like the sea, is restless and changing—occasionally tranquil, but more often surging and confused. But just as there are predictable currents and tides in the sea which require a ship to change course if it is to reach its landfall, so also are there certain identifiable currents and trends in society, which, given careful study and assessment, can indicate new directions for society's institutions.

Higher education is one of those institutions which, until recently, has

been guided by tradition. But since American society is not tradition-directed, many problems have arisen which could not be solved by educational approaches of the past.

What are some of the societal and technological trends which demand that higher education seek new directions—which have given impetus to the development of the community junior college in America? Here are a few:

- The increasing complexity of everyday life in an urban, industrialized society.
- The explosion of technical and scientific knowledge which has characterized the past four decades.
- The alarming increase in sophistication and complexity of occupations at all levels.
- The fact that in our society education stands between man and his job —that lack of education is a barrier between men and jobs.
- The virtual disappearance of unskilled (common labor) jobs.
- The impact of automation and the flow process industries on production, on jobs, and on people.
- The action and reaction within a free society which leaves no person content "to stay in his place."
- The realization that knowledge is the key to a better life—not just for the few, but for the many.
- An awareness of the fact that if "only the educated are free," then all the free must be educated to the maximum of their capabilities.
- The needs of industry and business for semiprofessional ("middle level") manpower.
- A manpower shortage in professional, semiprofessional, and technical categories; contrasted with devastating unemployment in the unskilled and semiskilled categories.
- The realization that a "disaster gap" is opening up between those of our citizens with advanced education and those with little education.
- The urgent need for millions of citizens who can both think and do—and the gradual disappearance of a bi-polar society in which an elite few did all the thinking, and the rest did all the work.

SOME DEFINITIONS OF TERMS USED IN JUNIOR COLLEGES

Clarification of terminology may be helpful at this point. Even within junior college circles, unanimous agreement on the following definitions might not be obtained, but they will set a pattern for the content of the rest of the Bulletin.

- COLLEGE LEVEL STUDIES are conducted at the post-high school level in formally organized courses for which one semester unit of credit is given for a course which meets one hour weekly for fifteen weeks, or the equivalent. Two hours of outside preparation are expected for each class hour. College level studies are offered by institu-

tions granting the baccalaureate degree and also by those offering the associate degree, such as community junior colleges and technical institutes. Courses offered as a part of an organized curriculum in occupational education are *college level*, as well as courses in the traditional academic disciplines.

- OCCUPATIONAL EDUCATION refers to any and all education and training offered by junior colleges aimed at preparation for employment, as distinguished from curriculums in the liberal arts, the fine arts, or the humanities. "Occupational education" covers professional, semiprofessional, technical, and skilled-level curriculums for all fields (*e.g.*, agriculture, business, industry, health, home economics, public service) of employment.
- SEMIPROFESSIONAL EDUCATION is represented by formal curriculums leading to the associate degree and designed to prepare the student for employment in career fields recognized as nearly professional in status. Some examples: engineering technician, medical technician, architectural draftsman, business data programer, and associate degree registered nurse. Semiprofessional workers usually work in close cooperation with and perhaps under the direct supervision of a professional person.
- TECHNICAL EDUCATION is a term which is just beginning to acquire meaning in this country. There is no unanimously accepted definition of the term. For the purposes of this Bulletin, however, technical education—
  1. Is organized into two-year curriculums at the college level.
  2. Emphasizes work in the field of science and mathematics, and frequently, but not always, is related to industry and engineering.
  3. Gives much attention to technical knowledge and general education, but also stresses practice and skill in the use of tools and instruments.
  4. Leads to competence in one of the technical occupations, and usually to the granting of an associate degree.
  5. Includes a core of general education courses (English, humanistic-social studies, liberal arts) up to perhaps one-fourth of the total credit hours.
- TRANSFER COURSES are those offered by junior colleges which are accepted for full credit by a university or four-year college. They are usually in the traditional academic disciplines.

- VOCATIONAL EDUCATION, in the generic sense, is education and training the purpose of which is the preparation of students for employment or for a career—as distinguished from the liberal arts and the humanities in which emphasis is intellectual and non-utilitarian. Until recently, vocational education has been associated with high school and vocational (or trade) schools. Junior colleges only recently have begun to offer education and training for skilled jobs in agriculture, business, industry, and home economics fields. In vocational or trade training programs courses are ordinarily described in terms of class contact hours; in college level programs, in terms of semester hours spent in class or laboratory.
- TRADE AND INDUSTRIAL EDUCATION aims at preparing persons for employment in industry or in the service occupations (sometimes, but not always via apprenticeship) at the skilled and semi-skilled levels. Junior colleges can and should provide such programs when needed, but *such programs are not "technical education,"* and are therefore not the primary concern of this Bulletin.
- THE OPEN DOOR COLLEGE means a college where entry is unrestricted. Many courses and curriculums are available—some within the range of the student's interest and abilities, some outside his interests, and some beyond his ability. He need not choose what lies outside his interests, but on the other hand he cannot choose that which clearly lies beyond his ability. The "open door college" does not mean "the open door curriculum."

Quality within diversity must be the hallmark of the comprehensive community college if it subscribes to the "open door" concept. The open door college offers a wide range of programs, each at its proper level of rigor, and each of high quality for its intended purpose. Extensive guidance, counseling, and testing procedures operate to place students in curriculums and courses suited to their abilities and interests.

FLOW CHART FOR STUDENTS ENTERING A COMPREHENSIVE COMMUNITY COLLEGE THROUGH THE "OPEN DOOR"

SECTION II

College Level Occupational Education

Needs and Rewards

The technological and sociological changes discussed in the previous chapter have had significant impact on the labor force. The scientific and technical developments which have had the greatest influence in creating the occupational structure of this decade started with:

The Industrial Revolution—

triggered by James Watt's steam engine (about 1769) and the introduction of the factory system.
Further development occurred in the 19th century through

Mechanization—

in the textile, wood turning, and metal working industries, and in agriculture.
The late 19th and early 20th centuries brought the introduction of

Electrification—

spurred by the inventions of Thomas Edison and others.
The advantages of electrification, combined with growing mass markets and a new approach to manufacturing problems brought the concept of

Mass Production—

which was nurtured to full flower by the early Ford organization about 1915, but actually dates back to the time of Eli Whitney and his cotton gin (about 1800) for its first application.
These developments taken in the aggregate necessitated an expanded labor force with many workers in the skilled and semiskilled labor classifications. Mid-twentieth century industrialization brought, however, the

Flow Process Industries—

and

Automation—

resulting in a drastically reduced demand for semiskilled and unskilled workers; a steady demand for highly skilled workers; and a markedly

increased demand for technical, semiprofessional, and professional workers.

The march of technology has resulted in a new complexity and an increased sophistication of jobs at all levels in business, industry, agriculture, and public service. There is new emphasis on research and design in industry, and on a "systems approach" to the solution of problems. This decade—1960-1970—has produced

The Team Concept in Research, Design, and Production.

Technicians and other semiprofessional workers are key members of the team.

MANPOWER NEEDS OF THE NATION

The nation's changing manpower needs demand a tremendous expansion of college level occupational education. The accompanying table shows the occupational pattern as it was in 1940, compared to probable need by 1975.

DISTRIBUTION OF THE LABOR FORCE IN VARIOUS MAJOR OCCUPATIONAL GROUPS[1]
(United States, 1940-1975)

Major Occupational Group	Percents 1940	Percents 1975
Professional, technical, and kindred workers	8.0	14.2
Managers, officials, and proprietors, except farm	8.1	9.6
Clerical and sales workers	16.7	22.9
Skilled and semiskilled workers	29.7	29.3
Farmers, farm managers, foremen, and laborers	18.5	4.6
Service workers	11.9	14.4
Unskilled workers, except farm and mine	7.0	4.4

NOTE: Because of rounding, column sums do not total 100%

[1] Data from publications of the U.S. Department of Labor, Bureau of Labor Statistics.

The world of work in the 1960's is vastly different from that of a generation ago. Consequently, educational patterns must be developed which will be in the interest of youth and of society. A recent U.S. Department of Labor report[2] shows:

1. By the late 1960's, the U.S. labor force will be 20 per cent greater than it was in the 1950's; and it will have a higher percentage of young persons (18 to 25) than ever before in our history.
2. There are now more workers in nonmanual than in manual labor classifications. The United States is the first nation in history to achieve this status.
3. In the 1960's, professional, semiprofessional, and technical workers will increase by over 40 per cent; clerical and sales workers, by 26 per cent. In contrast, jobs requiring unskilled workers will actually *decrease.*
4. Gross national product (GNP) will increase by almost 50 per cent during the '60's, and while the over-all standard of living rises, the demand for unskilled labor will fall off markedly.

The accompanying chart will assist in the interpretation of occupational trends and in assessing the educational requirements of the middle and late 1960's. The upper half of the chart "matches" the 1930 educational "spectrum" to the 1930 occupational spectrum. They are approximate because of the inexactness of the data collected at that time. The lower half of the chart portrays the estimated spectrum of 1970 occupations and matches it with optimal educational requirements.

The three-level educational system of the 1930's roughly sorted young people into the various occupational categories shown. But in 1970, as the chart shows, this three-level educational system will no longer suffice. At one extreme, increased numbers of persons with baccalaureate and advanced degrees will be needed by 1970. At the other, very few jobs will be available for the person with only an eighth grade education. High school and/or vocational school education and training will be necessary for a much larger percentage of the labor force in 1970 than in the 1930's. However, the really significant change is in the middle of the two spectra. Managerial, semiprofessional and technical, clerical and sales, and highly skilled jobs will involve about half of the labor

[2] U.S. Department of Labor. *Manpower: Challenge of the 1960's.* Washington, D.C.: Government Printing Office, 1961.

OCCUPATIONAL TRENDS AND EDUCATIONAL REQUIREMENTS
(U.S. Labor Force—1930 and 1970)

force by 1970. Proper preparation for most of these jobs will require some college training, but usually not the baccalaureate degree. Community junior colleges, technical institutes, and business colleges are the institutions of our society which will educate the "middle fifty per cent."

Our society can no longer operate efficiently with the four-year educational gap which exists between the high school graduate and the college graduate. The two-year college is the logical answer to the problem of closing this gap; and, among the two-year colleges, it is the community junior college which can make the greatest contribution to the nation's manpower need. Of the kinds of two-year colleges listed, the community junior college is the only one with enough enrollment potential to make a significant impact on the nation's middle manpower problem.

Extent of Need for Technicians in Industry

The national need for semiprofessional and technician manpower is critical. The National Science Foundation, in a 1961 study[3] concluded that by 1970 the national need for technicians in industry alone would exceed 1,262,000. This figure, contrasted with the 630,000 employed in 1960, indicates that the supply must be doubled in the decade. Allowing for deaths and retirements as well as for *new* demands, almost 68,000 new technicians would have to be educated and trained each year to meet the 1970 estimated demand. It is doubtful that the current annual rate of production of technicians from all sources (junior colleges, technical institutes, industry training programs, and armed services schools) exceeds 35,000. Further, other sectors of the economy, such as government, education, and health fields employed another 240,000 technicians in 1960, and this figure will probably double by 1970 also. Most certainly there is a challenge here for the junior college.

[3] National Science Foundation and the U.S. Department of Labor, Bureau of Labor Statistics. *The Long-Range Demand for Scientific and Technical Personnel.* Bulletin NSF 61-65. Washington, D.C.: Government Printing Office, 1961.

THE REWARDS OF TWO YEARS OF COLLEGE STUDY

It can be seen that the need for technical and semiprofessional workers is great. But what does it mean to the student about to enter a two-year college program? Where does this kind of experience lead in terms of salaries, status, and working conditions? What are the material returns from the investment in a junior college education? Are they worth the postponement of plans and the sacrifice of time, money, and effort?

In short, what are the rewards, beyond the satisfaction of broadening social and cultural perspectives through acquisition of knowledge and new ideas, for the successful student in a two-year program? The potential rewards might be considered under *income, status,* and *working conditions.*

Income

Compare the following typical earnings, at the going rates for the mid-sixties.

	Hourly	*Monthly*
Male high school graduate, entry job, unskilled work	$1.25	$210
Male high school graduate, some experience, semiskilled work	$1.85	$300
Male junior college graduate, entry job, highly skilled technician	$2.50	$425
Female high school graduate, entry job, counter clerk, retail store	$1.00	$185
Female high school graduate, entry job, typist and office work	$1.50	$255
Female junior college graduate, entry job, semiprofessional secretary		$360
Male junior college graduate, entry job, semiprofessional technician		$490
Male junior college graduate, semiprofessional technician, after five years' experience		$650
Senior engineering technician, ten years' experience		$800

Some Other Examples:

Registered nurse (junior college graduate plus licensing)	$14 to $18 per day
Medical technician (three years of college plus two years' clinical internship)	$450
After five years' experience	$650
Data processing technician (junior college graduate plus two years' experience)	$500
Architectural draftsman (junior college graduate plus two years' experience)	$500
Policeman (junior college graduate in law enforcement program), entry job	$400-$500
Auto mechanic (junior college auto mechanic program plus five years' experience)	$400-$700
Medical office assistant (junior college graduate, entry job)	$275-$350

At these differentials it does not take long to recover the expenses of a junior college education and forge ahead of one's contemporaries who ended their education with high school.

Status

Education stands squarely between man and his job. High school preparation, of itself, no longer meets the educational demands of most professional, semiprofessional, and technical jobs.

The claim has been made that semiprofessional and technical workers are "key members of the team." They are important on the job, in their communities, in their service to humanity, in their contributions to national defense, and as research workers on the frontiers of science and space.

A few examples of the status of technicians:

- The work of from two to five technicians may be required before a physician who specializes in internal medicine can diagnose the malady of his patient.
- The number of technicians involved in a space shot may be two to three times the number of scientists and engineers.
- A group of three or four professional architects and engineers will need up to thirty architectural draftsmen as the firm prepares plans and specifications for a major building project.
- A scientist may conceive it, a few engineers may design it, but hundreds of technicians will be required to assemble, adjust, test, and operate a new radar telescope to probe outer space.
- Technicians save lives, provide entertainment, make world-wide communication possible, keep defenses at peak efficiency, make industry and business hum, open new frontiers, and live the good life themselves, as well-paid and highly respected members of society.

Working Conditions

- Technicians work everywhere—in glamorous places like Hawaii, in home towns like Dubuque, in the heart of San Francisco, in an embassy in Paris, and on a geophysical exploration truck in Timbuktu.
- Semiprofessional workers (including technicians) typically are salaried employees working in the research, planning, development, and evaluation activities of an enterprise.
- Technicians ordinarily work in clean, well-lighted, air conditioned laboratories, and other semiprofessional personnel such as dental assistants, secretaries, draftsmen, nurses, and data programers, work in comfortable and attractive surroundings.

TYPICAL EDUCATIONAL LEVELS AND JOB ATTRIBUTES OF THE RESEARCH-DESIGN-PRODUCTION TEAM

OCCUPATIONAL STATUS DEPENDS ON EDUCATION

People in These Occupational Groups	Have These Average Educational Attainments (Percents)		
	Less Than High School Graduation	High School Graduation	College Graduation or Some College
Professional and Technical Workers	6	19	75
Proprietors and Managers	38	33	29
Clerical and Sales Workers	25	53	22
Skilled Workers	59	33	8
Semiskilled Workers	70	26	4
Service Workers	69	25	6
Unskilled Workers	80	17	3
Farmers and Farm Workers	76	19	5

SUMMARY

The Needs of the Nation demand a rising level of education and training for the entire work force to meet needs in all occupational classifications.

The Needs of Youth and Adults center around the new relationship between man, education, and jobs. At the turn of the century, five per cent of the labor force worked in the realm of ideas and the other 95 per cent worked! Today, more than half the labor force is engaged in "work" whose intellectual content is such that post-high school education is essential.

Occupational Patterns are changing so fast in response to the new technology that education is never terminal. Most young workers now entering the labor force will have to effect a complete change in their work skills and knowledge at least three times during their working careers. Continued employment depends on continuing education.

The Impact of Automation cannot yet be assessed, but it is clear that even as the new technology has created unemployment it has also created an almost insatiable demand for *new skills* in unfilled jobs—teachers, engineers, technicians, scientists, medical personnel, semiprofessional workers in business, industry, and agriculture; and for thousands of workers in the service industries to "back-stop" the nation's productive effort. It may be that the ultimate answer to technological unemployment will have to involve these approaches:

1. Markedly increased levels of pre-employment education and training for almost all high school graduates.
2. Training and retraining, as now envisioned in a preliminary approach by the Manpower Development and Training Act,[4] to make adults with obsolescent skills employable again, or to enable the "underemployed" to move up the occupational ladder, thus leaving unskilled and semiskilled jobs for the unemployed to fill—the so-called "trickle-up" theory of full employment.
3. An awareness and an acceptance of the need for semiskilled persons in service jobs. Persons engaged in professional, semiprofessional, technical, and skilled jobs need their houses cleaned, their laundry done, their lawns mowed, their hair cut, and their gadgets repaired; and they are willing to pay others to perform these services. As the higher order tasks of society become more complex with each passing year, and as the lower order (production) tasks are relegated to machines, many of which are controlled by other machines, the service jobs will become the major source of employment for that one-fourth of the labor force which is without specialized education and training. The jobs are there—it is up to society to create a climate in which they will be acceptable. John Gardner has said: "The discipline of roles is as necessary in a democracy as in any other society, but it is only workable in a democracy so long as all the roles are honorable and decently rewarded. . . . We must learn to honor excellence (indeed to *demand* it) in every socially accepted human activity, however humble the activity, and to scorn shoddiness however exalted the activity."[5]

It would seem inevitable that community junior colleges will have to develop courses and curriculums leading to jobs in the semiskilled and service categories. The challenge is there and waiting. The needs of one-fourth of the labor force cannot be ignored.

SECTION III

The Spectrum of Middle Level Manpower

There is a wide range of technical occupations. Many technicians work at highly sophisticated levels in research, design, and prototype production. Theoretical knowledge approaching that of the professions, combined with some practical "know-how" about instruments, tools, and laboratory equipment is required for such work. Men and women in these jobs are coming to be called "semiprofessional technicians," and college level educational programs are required for their education.

At the other end of the technical job spectrum are those occupations which demand a high degree of manual skill and ingenuity, but require only a modest background in science, mathematics, and technical theory. Persons who hold these jobs are commonly called "highly skilled technicians." Many persons reach this level through on-the-job or armed services training programs, and a few via technical high schools and vocational schools, but the main avenue of the future will probably be through junior colleges and technical institutes since college study will be increasingly required in the future.

It is important to remember that there are many degrees and kinds of technicians between these two extremes. The gap between the professions and the skilled worker cannot be filled by one kind or level of technician —a great variety of talents and specialized abilities is needed.

Technicians work in a variety of fields, and terminology differs somewhat from one field to another. This chapter will discuss middle level manpower as found in the following areas of work:

Technicians in industry	Technicians in agriculture
Technicians in health fields	Semiprofessional personnel other than technicians
Technicians in business	

TECHNICIANS IN INDUSTRY

It is in industry that the "spectrum" concept is most applicable to the technician. *Engineering technician* is a term frequently used to describe semiprofessional technicians; and the term *industrial technician* is sometimes used to indicate those whose work is more nearly like that of the skilled craftsman. There are no generally accepted definitions of these terms, and job titles themselves are not always helpful. As examples, however, the following statements, in terms of job demands, are given:

SEMIPROFESSIONAL TECHNICIAN (Engineering Technician)

"Technicians work with engineers and scientists in virtually every aspect of engineering and scientific work. One of their largest areas of employment is in research, development, and design work. Technicians in this type of activity generally serve as direct supporting personnel to engineers or scientists. In the laboratory, they conduct experiments or tests; set up, calibrate, and operate instruments; and make calculations. They may assist scientists and engineers in developing experimental equipment and models, do drafting, and frequently assume responsibility for certain aspects of design work under the engineer's direction." [6]

"Engineering technology is that part of the engineering field which requires the application of scientific and engineering knowledge and methods combined with technical skills in support of engineering activities; it lies in the occupational area between the craftsman and the engineer at the end of the area closest to the engineer.

a) Engineering technology is identified as a part of the engineering field to indicate that it does not by any means encompass the entire field and also to differentiate it from other types of technology in areas such as medicine and the biological sciences. The engineering field is viewed as a continuum extending from the craftsman to the engineer. Engineering technology falls, in the continuum, between the craftsman and the engineer and closer to the engineer than to the craftsman.

b) Engineering technology is concerned primarily with the application of established scientific and engineering

[6] U.S. Department of Labor. "Employment Outlook for Technicians Who Work with Engineers and Physical Scientists." Bureau of Labor Statistics, Bulletin No. 1300-96. Washington, D.C.: Government Printing Office, 1962. (Reprint of article in *Occupational Outlook Handbook*, 1961.)

THE SPECTRUM OF TECHNICAL JOBS

Continuous Spectrum—Technicians

Craftsmen and skilled craftsmen

Production jobs requiring manual skills of a high order. Occasional need for technical knowledge. Repair, maintenance, and construction jobs.

Test, maintenance, and prototype production. Drafting, detailing, checking, estimating. Manual skills required, but technical knowledge essential also. Use of instruments and gathering of data under supervision.

Research and design activities in support of engineers and scientists. May work individually. Some manual skills, but major emphasis is on technical knowledge.

Basic research and design. Direction of research and production activities. Emphasis is on knowledge, not skills. Working at the "frontier" of knowledge.

Toward increased complexity and intellectual content of the job demands

knowledge and methods. Normally engineering technology is not concerned with the development of new principles and methods.

c) Technical skills such as drafting are characteristic of engineering technology. Engineers graduated from scientifically oriented curricula may be expected to have acquired fewer of these skills than previously and the engineering technician will be expected to supply them.

d) Engineering technology is concerned with the support of engineering activities whether or not the engineering technician is working under the immediate supervision of an engineer. It may well be that in a complex engineering activity he would work under the supervision of an engineer, a senior engineering technician, or a scientist.

An engineering technician is one whose education and experience qualify him to work in the field of engineering technology. He differs from a craftsman in his knowledge of scientific and engineering theory and methods, and from an engineer in his more specialized background and in his use of technical skills in support of engineering activities."[7]

HIGHLY SKILLED TECHNICIAN (Industrial Technician)

"The industrial technician is one who does not require an extensive knowledge of science and engineering in depth to perform his work. When an industrial technician is working he uses more craft and manipulative skills than he does engineering knowledge.

Some technical occupations are very limited in scope and level. In this group may be found such jobs as product inspection . . . or routine engine testing. . . . Such jobs are clearly not far from the craft worker, but are differentiated by the necessity for the technician to apply some science and engineering knowledge.

Some technical occupations deal with a large number of different skills and knowledge (scope) but do not require depth of knowledge (level) . . . and therefore are classed as industrial technicians' jobs. Such jobs include the laboratory technician who is capable of performing all the common tests, but is not able to interpret results; or a draftsman who is accomplished in mechanical, electrical, or aeronautical drawings but performs few layout or design functions."[8]

The *engineering technician's* job is one of relatively wide scope, calling for frequent application of mathematical and scientific principles. He must be able to apply these principles and his technical knowledge to a broad field of engineering-related industrial problems. Schaefer and McCord[9] have characterized the engineering technician as being *field-oriented*, in contrast to the *industrial technician*, who, since his work is usually connected with a specific job, is said to be *job-oriented*.

Another way to look at the spectrum of technicians is in terms of the education required. The semiprofessional (engineering) technician typically has had two or more years of post-high school education in a junior college, a technical institute, or a university extension center, whereas many highly skilled industrial technicians attain their job status without formal college work.

Table 3-1 suggests an approach to scope and level in junior college curriculums leading to competence in certain fields of semiprofessional (engineering) technology.

A number of junior colleges are presently offering programs in the engineering technologies, and many more will add these curriculums in the immediate future.

Programs of education and training for highly skilled (industrial) technicians have been offered in junior colleges, technical institutes, vocational-technical schools, certain technical high schools, evening extension centers (recently through the Manpower Development and Training Act), and industry (in-plant) training centers. Community junior colleges will be increasingly involved in educational programs of this kind.

TABLE 3-1

SUGGESTED COURSE AND SEMESTER CREDIT HOUR REQUIREMENTS FOR JUNIOR COLLEGE CURRICULUMS SEMI-PROFESSIONAL (ENGINEERING) TECHNICIANS

Divisions of the Curriculum and Suggested Courses	Semester Credit Hour Requirements (One credit for one lecture hour or for three lab hours)	
	Credit Hours	Percent of Total
Mathematics (technical) . . . covering algebra, geometry, trigonometry, slide rule, analytic geometry, applied calculus and advanced topics	10	13.5
Science for the technician—covering applied physics, or chemistry, mechanics, thermodynamics, metallurgy, etc.	10	13.5
Technical specialty courses basic to the student's major—elementary and advanced; theory and practice	30	41
Supporting technical courses—graphics, engineering laboratory, technical writing	6	8
General education courses—English, humanities, social studies, etc.	18	24
TOTAL	74	100

TABLE 3-2

SUGGESTED COURSE AND SEMESTER CREDIT HOUR REQUIREMENTS FOR JUNIOR COLLEGE CURRICULUMS FOR HIGHLY SKILLED (INDUSTRIAL) TECHNICIANS

Divisions of the Curriculum and Suggested Courses	Semester Credit Hour Requirements (One credit for one lecture hour or for three lab hours)	
	Credit Hours	Percent of Total
Mathematics—a one-year technical math course covering advanced arithmetic, algebra, geometry, trigonometry, and slide rule	6	8
Applied science—technical physics or technical chemistry	8	11
Technical specialty courses basic to the student's major—some theory, but emphasis on practice	36	49
Supporting technical courses—drafting, general shop, etc.	9	12
General education courses—English, humanities, social studies	15	20
TOTAL	74	100

Table 3-2 indicates the suggested scope and level of pre-employment junior college curriculums for highly skilled technicians.

While the foregoing definitions and suggested curriculum requirements may be helpful, it is of the utmost importance to recognize that there really is not a bi-modal distribution of technicians—the spectrum is a continuous one from the up-graded skilled craftsman to the degree engineer who may be temporarily doing technician's work. And junior colleges should provide programs for several levels and kinds of technicians—not just one level or kind.

CLUSTERS OR FAMILIES OF TECHNICAL OCCUPATIONS

Overspecialization is inadvisable. There is a growing trend among employers today to expect the graduate of a junior college or technical institute to be broadly educated and trained in programs with considerable depth in mathematics and science and related technical work rather than in just one specialty. Consequently, it is advisable to plan curriculums for "clusters" or "families" of jobs. Some of these "families" are listed below with just a few of the typical job titles associated with each. Some jobs in each family are semiprofessional, others are highly skilled. The first-year program for each "family" can contain a common core of studies, with much of the specialization occurring in the sophomore year.

MECHANICAL TECHNOLOGY

Air Conditioning/Refrigeration Technician
Airframe Technician
Automotive Technician
Diesel Technician
Engineering Aide
Hydraulics Technician
Machine Drafting Technician
Missile Technician
Operating (Building) Engineer
Precision Measurements Technician
Tool and Die Technician

ELECTRICAL/ELECTRONIC TECHNOLOGY

Aviation Electronics Technician
Communications Technician
Computer Technician
Electrical Power Technician
Electronic Drafting Technician
Industrial Electronics Technician
Microwave Technician
Missile Electronics Technician
Radar Technician
Radio and Television Technician
Sound Systems Technician
Transmitter Technician

CIVIL TECHNOLOGY

Architectural Draftsman
Building Construction Technician
Concrete Technician
Estimator
Map Draftsman
Sanitation Technician
Specification Writer
Structural Testing Technician
Surveyor (Engineering Aide)

ENGINEERING LABORATORY TECHNOLOGIES

Ceramics Technician
Chemical Technician
Instrumentation Technician
Metallurgical Technician
Optical Technician
Plastics Technician
Research Technician (many grades)

CERTIFICATION OF ENGINEERING TECHNICIANS

In an attempt to set standards of job performance and education for engineering technicians there has been formed recently the Institute for the Certification of Engineering Technicians, with offices at 2029 K Street, N.W., Washington, D.C. Sponsored by the National Society of Professional Engineers, the Institute determines, by written examination and investigation of job performance, the competency of those who apply for certification.[10]

[10] See Williamson, Merritt. "The Institute for the Certification of Engineering Technicians." *Journal of Engineering Education* 54, No. 2, October 1963.

TECHNICIANS IN THE HEALTH FIELDS

By tradition, we tend to think of the health and medical team as composed of two persons—the doctor and the nurse. Although these two are still the key figures in the health fields, there are today many other kinds of workers, most of them at the semiprofessional level, whose knowledge and skill are essential to the care of the sick and the injured and to preventive medicine and medical research.

More than 100 different job titles can be identified[11] in the health occupations field. The list which follows includes just a few of these jobs. The junior college can and should assume an important role in the education and training of these workers.[12]

- Dental Assistant
- Dental Laboratory Technician
- Electrocardiograph Technician
- Histologic Technician
- Medical Laboratory Technician
- Medical Office Assistant
- Medical Record Technician
- Optical Technician
- Psychiatric Technician
- Radioisotope Technician
- Registered Nurse (Associate Degree)
- X-ray Technician

Every study which has been made in the medical manpower field in recent years has come to the same conclusion—a critical shortage of workers in all the semiprofessional classifications exists, and probably will continue to exist in the forseeable future. No enterprise offers a greater challenge to the junior college than that of expanding education in the health fields.

Most of the health occupations are regulated by state law, and licensed by the appropriate legal bodies (usually state boards). The scope and level of educational programs are frequently stipulated, and in-service work experience or internship is often required. Further, most of the health occupations groups have national and state associations which often set standards higher than those required by law. Junior colleges contemplating the establishment of educational programs in the health fields should enlist the cooperation of the appropriate associations, ordinarily through local chapters.

BUSINESS-RELATED OCCUPATIONS

The successful business enterprise can no longer operate with only a few typists and bookkeepers. Today's business office is automated to a considerable degree. Fewer hand workers, but more "think workers" are required. Technicians are required for business data processing, machine accounting, inventory control, customer billing, information retrieval, microfilming of records, and copy reproduction. The private secretary, too, must supplement her typing and shorthand with many new skills and abilities to meet the demands of her position today.

Here are a few of the job titles of the semiprofessional and technical occupations associated with modern business.

- Bookkeeper
- Business Data Programer
- Buyer (Retail Store)
- Data Processing Technician
- Department Manager (Retail Store)
- Graphic Arts Technician
- Insurance Salesman
- Legal Secretary
- Library Assistant
- Medical Secretary
- Office Supervisor
- PBX Operator-Receptionist
- Private Secretary
- Real Estate Salesman
- Statistical Technician
- Technical Illustrator

With modern methods of communication, reproduction and storage of records, and information retrieval, the numbers of typists, file clerks, and stenographers needed by business offices has reached a plateau and may even begin to decline in the near future. The new technology in the business office requires persons with new knowledge and skills—most of them at a level beyond that which the high school can provide. Predictions of current and future needs are difficult to make, but experienced occupational analysts estimate that some 25,000 new workers each year will be needed to meet the expected demand for office workers with semiprofessional and technical competencies.

Business education programs in junior colleges should probably be expanded at several levels and in many fields, but especial attention should be given to new programs for business office technicians.[13]

[13] Van Wagenen, R. C. "Business Education Enrollments in California's Public Junior Colleges." *California Schools* 34: 155-62; May 1963.

TECHNICIANS IN AGRICULTURE

Although the family farm is still a vital factor in the nation's economy, agriculture is changing with almost revolutionary impact. In many regions corporate agriculture is the response to the new technology. The agricultural businessman is replacing the "farmer" in some areas. Success in corporate farming and, indeed, on the family farm, too, depends today on the farmer's approach to new problems in the production, processing, distribution, and marketing of his products. Production and processing are becoming more and more science- and engineering-based, and distribution and marketing, business-based. The need for professional agronomists, engineers, chemists, biochemists, economists, and marketing specialists is accompanied by an equally great need for semiprofessional and technical personnel to assist in research, construction, analysis, production, purchasing, processing, and distribution.

Junior colleges in regions where agriculture is of economic importance should consider the feasibility of providing two-year associate degree programs for some or all of the following fields:[14]

- Agricultural Business Technician
- Agricultural Engineering Technician
- Agricultural Processing Technician
- Agricultural Research Technician
- Sales and Service Technician
- Farm Operator (owner or manager)
- Landscape and Nursery Technician
- Soils Technician

[14] For an extended discussion of agricultural technicians see: California State Department of Education. *Technicians in Agriculture.* Report of a Research Project in Agriculture Technology—California State Department of Education, and Modesto Junior College. Sacramento: the Department, 1962.

RELATIONSHIP OF CURRICULUMS TO OCCUPATIONAL LEVELS AND JOB FIELDS

Occupational Level	Employment Field	Examples of Job Fields and Job Titles	Kind and Level of Curriculum Required: General	Kind and Level of Curriculum Required: Specific Attributes
Semi-Professional	Engineering and Industry	Technician jobs in electronics, mechanical, civil, chemical and other fields. Emphasis on research, design, and prototype production. Work with scientists and engineers.	"Job-cluster" orientation. Emphasis on science, mathematics, and technical content. Skill training a secondary objective.	Emphasis on applied sciences. Mathematics through applied calculus. Technical and supporting-technical courses with considerable rigor. Significant general education content.
	Business	Business management, machine accounting, business data processing, sales, advertising, real estate, high level secretarial.		Emphasis on business theory, with some economics, marketing, etc. Strong program in English and mathematics of business. Rigorous program in the technical specialty, with significant general education content.
	Health	Nursing (R.N.), medical and dental technology, X-ray and radioisotope technology, medical research assistant, medical and dental office assistant.		Emphasis on the natural sciences. Significant content in the humanities and social sciences. Rigorous work in the technical specialty.
	Public Service	Law enforcement, fire service, sanitation, conservation, forest technology.		Strong preparation in both natural sciences and social sciences. Thorough preparation in the specialty, with significant general education content.
Highly-Skilled	Industry	Technician jobs in specialized fields, as automotive and diesel technology. Emphasis on testing, maintenance, operation, and production.	Specific job orientation. Some theoretical content, but major emphasis is on specific technical skills.	Emphasis is on specialization in a relatively narrow job field. Mathematics through trigonometry. Practical physics or chemistry. Much attention to skill development.
	Business	Stenography, office machine operation, PBX operator, bookkeeper.		Introduction to business, business mathematics. A general education core, but heavy emphasis on development of office skills.
	Health	Practical nurse, medical lab assistant.		Some general education, but major emphasis on skill development.
Skilled	Industry	Craftsmen and operatives in production, construction, maintenance, and repair; mechanics, artisans, and repairmen.		Trade mathematics and practical sciences. A core of general education, but primary emphasis on skill development. Many of these vocations require an apprenticeship. May be short-term courses.
	Business	General office work—typing, filing, duplicating. Retail sales work.		May be short-term courses. Heavy emphasis on skills. Some mathematics and English.
	Service	Food processing and preparation. Cosmetology, service station attendant.		Some basic science and general education but emphasis on skill development.

OTHER SEMIPROFESSIONAL OCCUPATIONS

Two relatively new fields of employment for semiprofessional and technical personnel are in (1) scientific laboratory research and in (2) the public service occupations.

Technicians in scientific research (nonengineering) laboratories must have preparation which is heavily science- and/or mathematics-based. Emphasis may be in either the physical or the biological sciences, depending on the research field.

Scientific research technicians (as distinguished from engineering technicians discussed previously) are illustrated by these job titles:

- Biological (Zoological) Technician
- Biophysical Technician
- Chemistry Research Technician
- Geophysical Technician
- Hydrographic Technician
- Mathematics Aide
- Meteorological Technician
- Physics Research Technician
- Radioisotope Research Technician
- Spectroscopy Technician

In *public service*, persons with two years of college work are finding increasing employment opportunities in such jobs as:

- Crime Laboratory (ballistics) Technician
- Fireman (city, county, and state agencies)
- Forest Conservation Technician
- Mosquito Abatement Technician
- Patrolman (law enforcement agencies)
- Sanitation Technician
- Wildlife Management Technician

SUMMARY

This, then, is the *spectrum* of middle level manpower. These jobs, considered in their aggregate, will account for nearly 30 per cent of the labor force by 1970. Today's high schools do not offer adequate preparation for these jobs, nor do four-year colleges and universities. Responsibility for the necessary preparation rests, instead, with the community junior college. But the educational programs must take new directions—they must be oriented toward middle level youth rather than academically superior youth. The educational programs for these youth must be characterized by diversity, rather than conformity; by the real quality of good teaching, rather than by highly selective admissions policies only; and by practicality rather than by sheer intellectuality.

The middle fifty per cent of high school graduates are the future technicians and semiprofessional workers of our society. They outnumber academically "superior" students by two to one. Their educational needs are important, and the educational programs for these youth are respectable. Their need is also the nation's need. Junior colleges are uniquely fitted to serve both.

SECTION IV

Planning Educational Programs

New directions in higher education must be sought wisely. A new course should be charted with great care and with the advice and assistance of those familiar with the route.

In this section some planning methods will be identified, and the experiences of some junior colleges with outstanding programs of occupational education will be pointed up.

ASSESSING THE NEED

The need for an educational program can be assessed in terms of national needs, state or regional needs, and local needs.

The local need can be looked at in two different ways: needs of local youth and adults for the education and training which will qualify them for jobs, and needs of local industry and business for competent workers.

National and state needs for semiprofessional and technical personnel can usually be assessed from manpower studies by the U.S. Department of Labor, the National Science Foundation, the U.S. Office of Education, and the United States Chamber of Commerce, as well as from the reports of state agencies.

Regional and local manpower needs of industry and business are usually not a matter of public information. They have to be determined locally by the community junior college and other local agencies (chambers of commerce, businessmen's associations, manufacturers' and dealers' associations, and state employment service branch offices).

Techniques of conducting a "community occupational survey" are already well known.[15] In general, two approaches might be considered in making such a survey: (1) the "team of experts" approach; (2) the "citizen participation" approach.

If several agencies desire to cooperate and provide for an exhaustive survey of the community's economy, the "expert" survey is probably better. A management consultant firm or consultants from a university may be employed to study the community's economic life, collect complete information on the labor force, and make projections. Here the community agencies raise the necessary funds and enlist the cooperation of individuals, business firms, and local agencies in obtaining the desired information.

On the other hand, if a community survey is to provide information primarily for educational purposes, the "citizens' participatory study" is ordinarily more productive. As implied, emphasis is placed on the participation of citizens representative of all segments of the community. An experienced survey director is essential, of course, and outside consultants may be required.

In a community whose population is 100,000 or more it would be normal practice to involve a hundred or more citizens in the survey. A public information program is started; committees formed and tasks assigned; survey instruments are constructed, evaluated, and revised; and "pilot" studies are used to perfect the survey techniques. The date for the start of the survey should coincide with the peak of public interest. Personal visits, which are far more productive than mail-out questionnaires, should be used where possible. Follow-up should continue until the greatest possible percentage return has been obtained. Then raw data may be compiled by clerks and by machine methods, but the data should be analyzed and interpreted by subcommittees under the supervision of the survey director. Each subcommittee should be responsible for the writing and editing of a chapter or section of the report. The report should be attractively reproduced and widely distributed.[16]

One advantage of the citizens' participatory survey is its relatively low cost; but far more significant is the fact *that is has involved hundreds of local people.* It is their survey for their junior college. The rationale and interest developed during the survey will pave the way for implementing the findings. The necessity for "seeking new directions" for educational effort will already have been made apparent. Comprehensive

[15] See Zapoleon, Marguerite Wykoff. *Community Occupational Surveys.* U.S. Department of Health, Education, and Welfare, Office of Education, Vocational Education Bulletin No. 233. Washington, D.C.: Government Printing Office, 1942. See also State University of New York. *Conducting a Job Opportunity Survey of Your Community.* Albany, N.Y.: the University, 1945.

[16] See The University of Michigan, Bureau of School Services. *Citizens Survey of Washtenaw County Community College Possibilities.* A survey directed by Raymond J. Young. Ann Arbor, Mich.: the University, July 1963.

occupational surveys should be supplemented by "spot" surveys within specific industries whenever a need is sensed or apparent.

Occupational surveys are not the only means by which new curriculums come into being. The president of the college, the dean or director of technical education, department heads, coordinators, and faculty are all sources of curriculum building ideas. The mere evaluation of needs which already exist is not enough; alert educators should be able to sense or anticipate needs for training before the need actually exists.

ASSESSING CAPABILITY

Educational programs may be direly needed, but the capability to provide them may be lacking. After a need survey is completed, an institutional self-study to determine capability should be undertaken. Semiprofessional and technical education programs must be of good quality or the student, his future employer, and the college's reputation will all suffer. Affirmative answers to the following questions should be assured before the decision is made to offer a new curriculum, even if the need for it has been definitely established:

1. Can well-qualified faculty be obtained?
2. Will suitable space for classrooms, laboratories, and shops be available?
3. Can tools, instruments, and specialized equipment of high quality be provided in sufficient quantity?
4. Will the budget permit expenditures for replacement of worn-out and obsolescent equipment?
5. Can coordinating, placement, and guidance services be provided?
6. Are students with the necessary ability and interest available in sufficient numbers?
7. Will all these factors result in a program which will satisfy student and community needs at a reasonable unit cost?

The following suggestions are worth considering:

1. Develop the technical program one careful step at a time, or the first program may be the last.
2. Make good use of advisory committees. Their work is only *advisory*, but listen to their ideas.
3. Consider regional cooperation in offering certain very expensive or very rigorous programs. For example, data processing, computer electronics, dental technology, might be developed regionally, with one junior college or technical institute in the region "specializing" in a given curriculum area.
4. Develop cooperative work-study programs in some of the technical fields. Realistic training and effective placement are inherent in co-op technology programs.
5. Put the emphasis on *good* programs rather than on the proliferation of programs.

STEPS IN CURRICULUM PLANNING

The Administrative Organization

Curriculum development has its beginning and its fruition in cooperative faculty effort. This kind of effort does not take place in a leadership vacuum. To set goals and then accomplish them through the work of people requires organization and administrative leadership in colleges as well as in other agencies of human endeavor. And junior colleges where programs of semiprofessional and technical education are being developed need an extremely high quality of leadership for the following reasons:

1. Departure from tradition frequently meets with indifference and sometimes with resistance from those who like the *status quo.*
2. Academicians on the faculty and on the board of trustees might regard any trend toward "vocationalism" with suspicion and may oppose it either directly or indirectly.
3. New kinds of knowledge and skills are required to plan meaningful programs of occupational education.
4. The cost of occupational education programs is likely to exceed that of traditional "academic" programs.
5. New kinds of laboratories and classrooms will be required.
6. A new and different emphasis in guidance must be achieved. Vocational guidance must be stressed, as well as educational and personal guidance.

Only through personal involvement of top administration will occupational education programs start properly and continue to grow. The technical program must be as prestigious in the eyes of the president as the academic or "transfer" program. He must identify himself with both programs. His attitudes will be reflected by faculty, students, and the community at large.

It is of the *utmost importance* that the occupational education program be provided with the same high quality leadership which is given to the transfer program. The dean in charge of occupational education should be at the same level of administration as the dean in charge of the academic (transfer) program. The arrangement shown in the shortened organization chart of Fig. 4-1, is worthy of serious consideration.

FIGURE 4-1

SUGGESTED ORGANIZATION CHART FOR A COMPREHENSIVE COMMUNITY COLLEGE

An organization plan which places a tradition-directed "academic dean" between the president and the person who leads and directs the occupational program should be avoided. Such a scheme will automatically relegate the occupational program to second class status in the minds of faculty, students, and citizens, and may make access to the president difficult for the person in charge of the occupational program.

An even better arrangement than that of Fig. 4-1 in the opinion of some junior college leaders, is one in which no sharp, artificial distinction is made between academic (transfer) programs and occupational (technical) programs, but one in which a distinction is made between the liberal arts and the applied arts. This plan is shown in the shortened organization chart of Fig. 4-2.

FIGURE 4-2

AN ALTERNATIVE PLAN OF ORGANIZATION FOR A COMPREHENSIVE COMMUNITY COLLEGE

Here the dean of applied arts will be responsible primarily for leadership in occupational education, but he will also *administer a number of lower division transfer programs* which are "applied" in nature. Obviously he must have an intense interest in and a keen knowledge of the kinds of educational programs which bridge the gap between youth and jobs.

The dean of liberal arts will be dealing, for the most part, with transfer students and programs. But under his leadership, programs of general education and courses in English, mathematics, and the social sciences, will be planned and offered for employment-bound students.

In large junior college districts, where the chief administrator may be both president and superintendent, and where there are two or more campuses, a system with vice presidents is sometimes favored. Fig. 4-3 shows a chart giving occupational education the status and leadership it needs in a large district.

FIGURE 4-3

SUGGESTED ORGANIZATION PLAN—LARGE DISTRICT

The office of assistant to the vice president for occupational education might be a staff position. Plans and ideas would originate, for the most part, with the assistant, but would emanate as policy from the office of the vice president for curriculum and instruction. In this plan each campus would have an assistant dean for occupational education. Acceptance of the total role of the junior college system by all the vice presidents is essential. The president himself is the key to this acceptance and understanding. Instruction being the *raison d'être* of a college, the total instructional program should come to a focus in the person of the president. His philosophy will determine his actions, and his actions will determine the educational directions which the college seeks.

THE CURRICULUM COMMITTEE AND FACULTY INVOLVEMENT

Cooperative faculty effort can best be initiated through the activities of a college curriculum committee. The following suggested guidelines may be used for the establishment and operation of such a committee.

MEMBERSHIP

- Seven to fifteen members.
- President, deans, and directors of guidance and placement to be permanent members.
- Two (or three) department or division chairmen from applied arts.
- Two (or three) department or division chairmen from liberal arts.
- Several members from the faculty at large.
- Provision for rotating the positions held by department chairmen among the several departments.
- Provision for "staggered" terms, in order to preserve continuity.

OPERATING PROCEDURES

- Chairmanship rotates between dean of applied arts and dean of liberal arts.
- Committee concerns itself with *curriculum planning and development*, not merely with course approval and disapproval.
- Committee develops necessary forms and procedures for new curriculum and course proposals.
- Department chairmen and faculty are invited to meetings as needed, to propose or support curriculum and course changes.
- Members of the college's lay advisory committees are invited to certain meetings for their counsel on curriculum and course proposals.
- Committee develops standard format for course outlines to be prepared by instructors for every course offered by the college.
- A complete record of all meetings is kept, and the significant actions are reported to the faculty after each meeting.
- Subcommittees (augmented by faculty members not on the curriculum committee itself) are frequently appointed to study and make reports on curriculum matters which require careful study and detailed documentation.

- Committee actions, although quasi-official, are subject to the approval of the president and the governing board.

Curriculum Committee action will have its base in any or all of the following:

1. The findings of community surveys, and "spot" surveys.
2. The requirements of four-year colleges to which baccalaureate degree-bound students transfer.
3. Suggestions and proposals emanating from faculty members or from instructional departments and divisions.
4. Requests of student groups.
5. Requests and suggestions of lay advisory committees or of other citizens or citizens' groups.
6. Suggestions and proposals emanating from the coordinators, deans, and the president.
7. Suggestions and requests from high schools of the attendance area.

The continuing service of such a committee will assure cooperative faculty action in curriculum planning and development. Decision making on curriculum matters, subject to presidential and board approval, becomes a faculty function. Obviously, some proposals will be denied, and others which may seem to some to have questionable value will sometimes be approved; but on balance, a curriculum development program through committee action will result in the best possible faculty support of the total program of a community college.

HOW A NEW CURRICULUM COMES INTO BEING

The following order of events might well characterize the development of a new curriculum (in law enforcement, for example) at a community junior college. A similar sequence might apply to almost any other program.

- Having offered evening "up-grading" courses for local law enforcement agencies for several years, the dean of occupational education "senses" that a pre-employment program for entry jobs as patrolmen is probably a community "need."
- The dean discusses the idea with local law enforcement officials such as the chief of police, the county sheriff, and the chief officer in the area for the state police.
- If it is agreed that a probable need exists, an advisory committee is formed, consisting of the officials mentioned, plus training officers of the agencies concerned, and other local officials with an interest in, or knowledge of, law enforcement.
- A preliminary appraisal of the problem is made by this committee, and information is accumulated on—
  a. Education and training needs for entry jobs with each law enforcement agency.
  b. Legal and financial problems involved.
  c. Law enforcement programs at other junior colleges.
  d. Possible candidates for teaching in the program.
  e. Facilities and equipment required.
- A formal request for such a curriculum is prepared and submitted to the college curriculum committee.

- The curriculum committee considers the request, hearing evidence from—
  a. The dean of occupational education.
  b. The advisory committee.
  c. "Experts" in law enforcement training, called in to present testimony.
- If the curriculum committee views the request favorably, a subcommittee is appointed to plan the curriculum—content, scope, sequence of courses, rigor, entrance requirements, balance between specialized and general education, adequacy of space, availability of faculty, etc.
- If the curriculum committee approves the new curriculum, this action is forwarded to the president for his review and approval, and for presentation to the governing board.
- After board approval, a coordinator-instructor is named (or newly employed) to direct the program, plan the specific courses in detail, arrange for cooperative work experience for students with local law enforcement agencies, select textbooks, prepare information brochures, and recruit and select students for the program. This final phase of preplanning might well involve a full semester.
- The first class is selected, and instruction begins. Two years later, the successful students will graduate with the associate degree. The success of the program will in large measure depend on the placement and performance on the job of this first group of graduates.

EVALUATING THE TECHNICAL EDUCATION PROGRAM

Evaluation of the total educational program of the college should be a continuous effort. Periodic self-studies are useful for this purpose. The visits of representatives of the regional accrediting associations will spur institutional introspection. (The transfer program can be evaluated through yearly reports of four-year colleges on junior college transfer students.) No phase of the college's program should go unevaluated, but the suggestions that follow are primarily for guidance in evaluating the occupational education program. Emphasis is on semiprofessional and technical programs, but other kinds and levels of programs are not excluded. The entire occupational education program should be evaluated annually against such a set of guidelines, by a self-study or "grand jury" committee.

SUGGESTED GUIDELINES FOR EVALUATION[17]

Note: "Guidelines" have been grouped in categories for more ready applicability to an evaluation situation.

CATEGORY I—MEETING COMMUNITY NEEDS

1. Is there evidence that the college administration is aware of and sensitive to the occupational education needs of business and industry?
2. Is there evidence that there is effective liaison between the college and the industrial and business community? Between the college and other nearby colleges? Between the college and the high schools of the attendance area?
3. Is the college serving as an area technical-vocational center for youth and adults of the region? Does it serve for both training and retraining?
4. Is there evidence that lay advisory committees are appointed; that meetings are held regularly; and that occupational education programs reflect their participation?
5. Has there been growth and/or modification of the college curricular offerings during the past five years, in response to community needs for occupational education?
6. Have community occupational surveys, spot surveys, and/or other techniques been used to keep the college informed of community occupational training needs?

CATEGORY II—ADMINISTRATIVE "CLIMATE" AND ORGANIZATION

1. Is there evidence that the college gives status to technical education by assigning qualified directors and supervisors? Is the dean or director of the occupational program a ranking member of the "administrative team?"
2. What evidence is there that the administration recognizes and welcomes the responsibility of the college to provide occupational education?

[17] Adapted from a similar set of (unpublished) guidelines prepared by the Vocational-Technical Education Committee of the California Junior College Association in 1960.

3. Is there evidence that the salary schedule is equitable for instructors in technical and other occupational fields?
4. Is there evidence that the administration attempts to inform all faculty about occupational education goals so that better understanding of the junior college role can be achieved?
5. Does the president involve himself personally in the occupational program?

CATEGORY III—GUIDANCE, PLACEMENT, AND FOLLOW-UP

1. Is there evidence that the college guidance program aids students to choose a curriculum commensurate with their abilities as well as with their interests?
2. Does the college guidance program work cooperatively with the guidance programs of the local high schools?
3. Is there a satisfactory balance between vocational and educational guidance in terms of: (1) counselor time assignments? (2) follow-up procedures? (3) occupational and educational information?
4. Is there evidence of satisfactory use of faculty members from the technical and vocational fields in guidance?
5. Is there an awareness of the disparity between academic aspirations and ability? Is the guidance staff actively working to bring about a decrease in the percentage of students whose aspirations outstrip their academic abilities? Is there evidence that students who do not succeed in the first semester of a transfer program are successfully guided into an occupational curriculum?
6. Is there an active, centralized placement office?
7. Is there evidence that the placement office emphasizes *vocational placement* (*i.e.*, placement of students on jobs for which they have been trained in an occupational curriculum)?
8. Is there evidence of a well-planned follow-up program for students in occupational fields? Are records kept so that the following may be determined?
   a. Transfers to other majors in the college.
   b. Transfers to other colleges.
   c. Dropouts, and a sampling to determine causes.
   d. Placement on jobs (part-time and full-time).
   e. Employer acceptance of the student and of the student's educational preparation.
   f. The opinions of former students about their education and training at the college.
9. Are the successes of occupational education graduates adequately publicized?
10. Are adequate guidance and placement services provided for adult (evening) students?

CATEGORY IV—INSTRUCTION AND CURRICULUM

1. Is there evidence that the members of the instructional staff are well prepared, and teaching effectively in classrooms, laboratories, and shops?
   a. Have most of the instructors had employment experience within the fields in which they teach? (This criterion should be applied to teachers in business education, health and public service fields, home economics, and agriculture, as well as to teachers of technical and industrial courses.)
   b. Are instructors encouraged to obtain on-the-job experience by taking advantage of industry-business-education summer programs?
   c. Are instructors encouraged (with financial inducements) to participate in summer professional improvement programs such as National Science Foundation institutes or industrial work programs?
2. Is there evidence of evaluation of instructional practices? Are syllabi properly prepared for every course with an up-to-date copy on file in the dean's office?
3. Are instructional facilities, visual aids, mock-ups, field trips, effectively used?
4. Does the library have an adequate number of reference books in occupational education fields?
5. Is there evidence that instruction, in both content and method, is in step with the times? Are mathematics, physics, and graphics being taught as needed in today's technical occupations?
6. Are textbooks and other teaching aids current and suited to the courses in which they are being used?

7. Is there evidence throughout the occupational education program of the college an atmosphere of excellence in instruction?
8. Is there a college curriculum committee with broad faculty representation, and with a balance between academic and occupational education interests?
9. Are there work-study programs in operation for students in technical and business education programs?
10. Is there evidence that general education courses, approximating one-fifth to one-fourth of the total credit hours, are included in occupational curriculums?

CATEGORY V—FACILITIES AND EQUIPMENT

1. Is there evidence that the college is providing the necessary classrooms, laboratories, shops, equipment, and supplies for quality programs?
2. Has the college participated effectively in national and state programs which supplement local funds for technical and vocational education?
3. Has the college sought assistance from the educational foundations which have expressed an interest in semiprofessional and technical education?
4. Is there evidence of a planned program for replacement of obsolescent equipment with up-to-date equipment?
5. Is occupational education sharing equitably in the current operating budget? In the capital outlay budget?
6. Is there effective liaison with business and industry to encourage contributions of equipment and funds?
7. Has the college been active in obtaining equipment, tools, and supplies from stores declared surplus by the Department of Defense?

SUMMARY

Curriculum planning for junior college occupational education programs must be a cooperative faculty effort conducted within a framework of competent leadership provided by the president and the deans. The support of the board of trustees is essential, of course, and so also is the interest and support of the community. Employers are always interested in youth with more knowledge and more highly developed skills for the increasingly complex jobs of today's economy. Parents of "middle level ability" youth are much interested in post-high school occupational education for their sons and daughters.

But it is only through *action* by faculty and administration that the comprehensive community college becomes a reality. The junior college becomes the "people's college" only when the faculty makes it so. And the faculty will make it so only when the president himself leads in charting the new course.

SECTION V

Concept and Practice In Curriculum Development

Some general concepts related to junior college technical education curriculums will be discussed first in this chapter, and then some "model" junior college curriculums which have been successful will be presented. The chapter closes with a brief review of some "instructional innovations."

DEFINITIONS AND LEVELS

Terminology is a problem for first consideration. Definitions are troublesome—especially when applied to jobs, for a man's job is his personal status symbol. A clerk may think of himself as a "professional," even though his job is listed as "clerical and kindred." Today's auto mechanic may call himself a technician, but he is classified officially as a skilled tradesman. The word "engineer" may be combined with technician in some job titles. A similar difficulty also arises in defining kinds of educational programs. However, some definitions will be necessary for the discussion which follows:

1. *Semiprofessional education* is organized in college-level curriculums of two or more years in length, leading to an associate degree, and designed to prepare the student for employment in one of several fields recognized as nearly professional in status. Examples of semiprofessional jobs are registered (bedside) nurse, private secretary, research assistant, architectural draftsman, medical technician, engineering technician, surveyor, business data processing technician.
2. *College level technical education* is one kind of semiprofessional education. It is carried out in junior colleges, technical institutes, and extension centers of some four-year colleges. It emphasizes work in mathematics and science, and is frequently, but not always, related to engineering at the research, design, and development level; gives major attention to specialized technical content, but also stresses skill in the use of instruments and specialized tools; provides the educational foundation, in terms of mathematics, science, and general education, for future growth in the technical occupations and for the responsibilities of citizenship; and leads to occupational competence in the chosen field of technical specialization.
3. *Technical training for highly skilled occupations* consists of curriculums, courses, and experiences leading to competence in industrial jobs where the major emphasis is on production, maintenance, operation, or testing. It may, but does not have to, lead to an associate degree, and it may be highly specialized, with relatively less content in basic sciences and in general education than is characteristic of semiprofessional technical education programs.

In the engineering and industrial field, community colleges should provide several curriculums in the technologies at different levels, ranging from college-level engineering technology to courses for highly skilled technicians to accommodate the needs of business and industry and also the abilities and interests of students. Many recent occupational surveys support this conclusion.[18]

The necessity for several levels of technical education has resulted in some confusion and controversy over the *quality* of the program. The *confusion* has been common among students, parents, and employers, while the *controversy* has occurred largely among educators.

A good distinction between *quality* and *level* of program comes from a recent evaluation of engineering technology education, an excerpt from which is quoted here:

> "The *level* of a program is determined by its objectives, and the *quality* by how well it achieves its objectives. If, for example, the objective of a program is to train retarded persons to perform simple household tasks, it may excel at accomplishing this objective. On the other hand, a graduate program in a highly abstract field may well be of poor quality."[19]

A concept of *quality within diversity* must pervade the technical education program of the community junior college. That rigor must be maintained which is essential to quality within a given level. Certain engineering technology programs, for example, possess a level and quality which

[18] Dauwalder, Donald D. *Education and Training for Technical Occupations.* Los Angeles: Los Angeles City School District, Division of Extension and Higher Education, 1961.

U.S. Department of Labor. *Technical Occupations in Research, Design, and Development.* Washington, D.C.: Government Printing Office, 1961.

[19] American Society for Engineering Education. *Characteristics of Excellence in Engineering Technology Education.* James L. McGraw, Project Director. Urbana, Ill.: the Society, 1962. p. 13.

results in accreditation by the Engineers' Council for Professional Development (ECPD). Other programs with different objectives *may be of a different level, but of equally high quality.*

The "*quality within diversity*" concept is admittedly difficult to maintain, but certainly not impossible. Many community junior colleges have done it for years. Outstanding leadership and a high quality faculty seem to be the attributes of colleges where this concept has been successful.

In summary, it seems clear that three kinds or levels of technical education should be recognized, and curriculums and students selected accordingly:

1. College level semiprofessional technical education for business, industry, health, agriculture, and public service fields;
2. Technical education for highly skilled technicians in industry and other fields;
3. Technical *training* programs for industry and business, with courses for employed adults aimed primarily at job up-grading; or for unemployed adults aimed at retraining.

TECHNOLOGIES RELATED TO ENGINEERING AND INDUSTRY

Mathematics and physics constitute the foundation of curriculums the purpose of which is to prepare technicians for fields related to engineering and industry. It should be recognized, however, that the classical sequence of compartmented mathematics courses (algebra, trigonometry, analytical geometry, calculus, etc.) and the typical general physics courses are not well suited to the demands of technical education programs. Technician students should not be scheduled in the same mathematics and physics sections with students of science and engineering. The sequence of these courses is not suited to technical curriculums, and the content includes much of the abstract that technicians will not need, and omits much of the practical which they must have. Furthermore, the level, *if properly planned for future scientists and engineers,* is too rigorous for future technicians. In such cases the *level* is pitched so high that the *quality* of the technical program suffers. Moreover, the instructors of these transfer courses are sometimes reluctant to work with students who are interested in the course as a tool subject rather than as an academic discipline.

Consequently, the terms "technical mathematics" and "technical physics" will be used here to refer to courses especially designed for technicians. Brief descriptions of such courses will be given in a later section.

For purposes of illustration, a number of curriculum patterns in various technologies related to engineering and industry follow. All of those included are in actual operation at some junior college or technical institute in the United States. It is emphasized that they are illustrative only; and there is no intent, expressed or implied, that these patterns need be imitated in order to achieve quality.

A CORE CURRICULUM IN TECHNICAL EDUCATION

Some community colleges offer only *engineering technician* curriculums, and these are sometimes at the level of the "engineering" student rather than the "technician" student. There are two reasons why such an approach is not advisable:

1. Students whose abilities are at the engineering level should be encouraged to enter engineering curriculums, not technician curriculums.
2. Technician programs which almost parallel lower division engineering curriculums result in high attrition rates, too few graduating technicians, and general dissatisfaction with the community college's technical education program. In some communities, such an approach has resulted in the establishment of a post-high school technical school to serve a need which the "community" college has chosen to ignore.

Programs designed to educate semiprofessional (engineering) technicians and those for highly skilled (industrial) technicians have a number of common factors. Both emphasize mathematics and science, and both should include certain general education experiences in English, history, economics, psychology, and similar courses. Greater depth of preparation in mathematics and science is required for engineering technician students than for industrial technician students; and the rigor of most of the courses in the major technical specialty is greater for the former than for the latter.

Some junior colleges and technical institutes with large enrollments in technical education prefer to establish two curriculum tracks—one at the semiprofessional technician level, and one at the highly skilled technician level. Under this plan all, or nearly all, of the courses required in the semiprofessional curriculum are different from and possibly more rigorous than those for the highly skilled technician curriculum.

Colleges just beginning a technical program, or colleges with small enrollments cannot, however, provide such a proliferation of courses. Furthermore, if "superior" students are being encouraged to elect a 'transfer" or pre-engineering curriculum,[21] the student group from which technician enrollees will come is a "middle level" group. It will have sufficient homogeneity at the freshman level that a core curriculum for the freshman year is not only possible but actually has much more to recommend it than mere expediency.

All technician students need at least one year of college technical mathematics, and a full year of applied (or technical) physics, with laboratory. The teachers of these courses should have an applied or engineering approach, rather than a narrow subject-matter orientation or liberal arts approach. In the sophomore year, the engineering technician students will need considerable additional work in mathematics and in science-related technologies.

[21] Considering the critical shortage of engineers and scientists, this is the only defensible course of action.

A SUGGESTED CORE CURRICULUM

A suggested pattern of courses for the freshman year of junior college technical programs (suitable for a student group which may contain both industrial and engineering technicians), follows:

First-Year Core Curriculum [22]

Courses	Units	Hours Per Week Lecture	Hours Per Week Laboratory
English A-B	3 - 3	3	
Technical Mathematics A-B	3 - 3	3

TOTALS	19 -19	13	17

This pattern of courses and time assignments constitutes a heavy load, compared to the 16 semester units commonly accepted as a "full load" for college students. This heavy load cannot be avoided, for preparation of a competent technician in a two-year program requires such application. *Technical Mathematics A* might be waived (by examination) for students with four years of high school mathematics, and *Introduction to Graphics A* might be skipped by students with two or more years of high school drafting. Certain of the required courses might be taken in summer session to reduce the regular semester load.

THE SOPHOMORE YEAR

Academic performance in the freshman core may well determine the student's objective—semiprofessional (engineering) technician, or highly skilled (industrial) technician. The sophomore program suggested here may be used as a framework for building second-year programs for either objective. The general education courses could be common to both objectives, *but the sophomore mathematics is required only for semiprofessional technicians.* The technical specialty courses for semiprofessional technician students would probably all be different from and more rigorous than those designed for highly skilled technician students.

[22] Brief descriptions of the basic core courses are given beginning on page 70.

Second-Year Curriculum

Courses	Units		Hours Per Week Lecture		Hours Per Week Laboratory	
American History	3		3			
Economics		3		3		
Psychology	3		3			
Technical Mathematics C*	3		3			
Technical Mathematics D**		3		3		
Major Technical Specialty Courses***	10	12			20	24
TOTALS	19	18	9	6	20	24

Total Class Hours 1st Semester—29 Total Class Hours 2nd Semester—30

* Required of all semiprofessional (engineering) technician level students.
** Required only for electronics technology majors at the engineering technician level.
*** Highly skilled (industrial) technician students, since sophomore mathematics is not required, could be scheduled for greater blocks of time in their technical and skill courses in laboratory and shop.

BRIEF DESCRIPTIONS OF BASIC COURSES IN THE CORE CURRICULUM

Technical Mathematics A-B

Assumes a knowledge of elementary algebra. Starts with a review of methods of computation, then goes into a review of linear equations and the four fundamentals of algebraic operations. Elementary topics in geomentry are then presented. The first semester moves on rapidly through a unit on slide rule, and a consideration of elementary vector analysis, relating the latter to the trigonometry of the right triangle. A unit on logarithms and an introduction to graphical representation close the first semester.

The second semester begins with a thorough treatment of simultaneous equations, determinants, and quadratics. Then come algebraic functions, logarithmic and exponential functions, and trigonometric function analysis. Complex number and vector algebra are next, with J-operator being stressed. Advanced topics in algebra (including series and the binominal theorem) and advanced graphics end the second semester.

Technical Mathematics C

Technical mathematics A-B or mathematics through college algebra and trigonometry are prerequisite. Analytic geometry, differential calculus, and integral calculus are presented in a one-semester course built around applications to industrial and engineering problems. The course makes no pretense at holding the level of rigor which would be found in the regular "transfer" calculus course for engineers. Familiarization with, rather than mastery of, the calculus is the objective.

Technical Mathematics D

Technical mathematics A-B or equivalent is prerequisite, together with successful completion of a basic course in electric and electronic circuits. Number systems and their applications to electronic and transistor circuits are studied. The specialized mathematics of computers is emphasized. Boolean algebra and a detailed study of logical systems brings the course to a close.

Technical Physics A

A knowledge of elementary algebra and geometry is required. High school physics is desirable but not required. Technical mathematics A (or equivalent) must be taken concurrently, so that mathematics skills will keep pace with the needs of the course. The "level" approaches that of first-year engineering physics courses of twenty years ago, before calculus was required. The course stresses applications in the fields of industry and engineering technology.

Precision measurement, properties of matter, hydrostatics and hydraulics are studied first. Then comes force and motion and Newtonian mechanics. Vectors and graphic solutions are followed by a study of statics. Then comes dynamics, followed by rotary motion. The first semester closes with a detailed treatment of heat and thermodynamics, with unusual emphasis being placed on heat engines. A carefully planned laboratory course, meeting for one three-hour period per week, accompanies the lecture course.

Technical Physics B

The course opens with an elementary treatment of sound and acoustics. Further development of the theory of wave motion leads into the study

of light and optics. A rather extensive treatment of magnetism and electricity follows, with emphasis on d-c and a-c circuits and machines. An introduction to basic electronics follows, and the course closes with a brief treatment of nuclear energy for industrial purposes. Laboratory exercises accompany the lecture course, with one three-hour laboratory period per week. The laboratory investigations serve as bases for an introduction to the writing of technical reports.

English A

Prerequisite—three years of high school English and a SCAT (V) score at or above the 20th percentile on college freshman norms. A basic course in English composition for the employment-bound student in all fields. This is not a technical writing course, nor is it a "repair" course. It has the same general objectives as the basic course for transfer students, but deals with them at a somewhat less sophisticated level.

English B

Prerequisite—English A, or equivalent. Literature and speech for the employment-bound student. Emphasis is given to the development of reading and speaking skills. The selection of readings and the assignment of speech topics is such that students of middle level abilities will be challenged, but not discouraged.

Introduction to Graphics A

One two-hour laboratory per week. Basic drafting techniques, introduction to orthographic projection and isometric drawing. Use of engineering standards and handbooks. Dimensioning, sectional views; oblique and perspective systems. Elementary vector graphics, introduction to "simplified" drafting and elementary nomography.

Introduction to Graphics B

Continuation of Semester A. Intermediate and advanced orthographic projection. Additional and more advanced work in vector graphics, nomography, "simplified" drafting, and "exploded views." Introduction to freehand sketching.

Engineering Laboratory A

One-hour lecture and six hours laboratory per week. A processes and materials course intended to give future technicians a broad familiarity with production processes. Precision measurement; engineering standards; materials testing (destructive and nondestructive); elementary metallurgy; heat treating; introduction to welding; elementary foundry practice.

Engineering Laboratory B

Continuation of Semester A. Covers manufacturing processes. Introduction to machine tools and machining processes; sheet metal and plastics fabrication; introduction to manufacturing systems; estimating; production testing.

The core courses in history, economics, and psychology might possibly be selected from the regular "transfer" courses, but each case should be

considered on its own merits. A strong argument can be advanced that, for the economics and psychology work, the student whose goal upon graduation is immediate employment as a technician needs a course different from that provided for the student who is taking the first course in a subject matter field which may be his major for a baccalaureate degree. History and political science might be combined in a one-year "problems-approach" course.

Very little of such a program is intended for baccalaureate degree credit. In one sense this is regrettable, of course, but such loss of credit is not unique to technical education. Any change of educational objective always entails additional work. The transfer engineering student would face a great deal of "make-up" work also if he decided to change his objective to astronomy or life science. After careful testing and counseling, if the decision of student and counselor is for a technician career, then the curriculum must be tailored for that objective, not "doctored," to bring about some sort of hybridization between lower division engineering and technology.

It should be recognized, however, that some four-year colleges will accept almost all of a good two-year technology program and credit these units toward a *baccalaureate degree in technical education.*

ADVANTAGES OF THE CORE CURRICULUM PLAN

1. A basic level of attainment in general education, science, and mathematics and supporting technical courses is set for all technician students and thus employers can be assured of employees with potential for future growth on the job.
2. Narrowly specialized *training* is avoided, and emphasis is placed on *education*, with significant content in the "common learnings."
3. Problems of scheduling and class size are minimized.
4. Better assignment of instructors may result.
5. Students may switch from one technical major to another at the end of the first year, with minimum loss of credit.
6. When junior colleges agree to cooperate regionally on such a common core, there are advantages to students and employers throughout the area.
7. Instructional unit costs, which may be quite high in many technical fields, can be reduced to some extent.

SEMIPROFESSIONAL CURRICULUMS: HEALTH, BUSINESS, AGRICULTURE

HEALTH FIELDS

Many junior colleges offer educational programs in health fields such as nursing,[23] medical technology, dental assisting, and X-ray technology. The associate degree nursing program will be used for illustration.

REGISTERED NURSING PROGRAM

AGRICULTURE FIELDS

Agriculture is still the biggest "industry" in the United States, though it is changing rapidly under the impact of the new technology. Educating and training farmers is still very necessary, but programs for persons who will work in agriculture-related fields are even more important, especially in the junior college. Two programs will be used for purposes of illustration.

Note: It is again emphasized that the curriculum patterns listed on the foregoing pages are for illustrative purposes only and are not intended as models which would have to be followed, but as being indicative of the broad scope, the level, and the quality of community college occupational education programs.

THREE INSTRUCTIONAL INNOVATIONS

The new technology has had its impact on education as well as on business and industry. Not only are new "directions" apparent, but new educational methods are showing much promise. Added to engineering technology, industrial technology, health technology, and the others is the rapidly growing field of *educational technology*. In addition to such time-tested methods and devices as audio-visual aids and mock-ups, teachers now are using programed learning devices, open- and closed-circuit television, and specialized learning laboratories or forums.[27]

Innovations in instructional method hold special interest for technical educators, for several reasons:

1. Most of them allow learning to proceed at differing rates, and they are therefore suited to the rather heterogeneous ability levels of the middle 50 per cent of students.
2. Specialized (sophomore) courses in technical fields usually have high unit costs. Since some of the new techniques and facilities show promise of preventing a further rise in unit costs, they should be investigated thoroughly.
3. Because well-qualified faculty for technical education programs are in continual short supply, any technique or facility that allows a "master teacher" to reach greater numbers of students must be exploited.

PROGRAMED LEARNING

Presently, programing of subject matter for student learning can be done through the use of programed textbooks, and by means of "teaching machines" with electronically sequenced programs, usually on tape.

It is too early to assess the promise of programed learning with any degree of objectivity. Tentatively, however, some conclusions can be drawn from several years of junior college experience in widely scattered locations. Programed learning techniques—

[27] Johnson, B. Lamar. "Islands of Innovation, Report of a Cross-Country Survey of Experiments in Teacher Utilization." *Junior College Journal* 34: 9-14; February, 1964. (A complete report of this study will be published by the Junior College Leadership Program, University of California, Los Angeles.)

1. Have shown considerable promise in home-study or outside-of-class learning.
2. Make it possible for a student to proceed at his own rate, and are, therefore, of great value to both slower learners and very rapid learners.
3. Assist in the "reinforcement of learning" or "overlearning" which assures retention.
4. Are particularly well suited to subject matter which builds a new concept or idea on the foundation of concepts previously learned.
5. Are excellent for review and drill, and since these purposes may then be served out of class, class time may be used more effectively.
6. Have produced learning in electronics and mathematics essentially equivalent (but not clearly superior) to standard classroom teaching methods, in a carefully controlled research study.[28]

[28] See Collins, John J. "An Experiment in the Use of Teaching Machines." *Junior College Journal* 33: 73-77; October 1962.

7. Are probably most applicable to subject matter which is factual and relatively static from year to year (*e.g.*, mathematics, electricity, hydraulics, English grammar); and do not seem to hold much promise for classes emphasizing interpretation, controversial issues, development of attitudes, or the development of oral and written expression.
8. Evidently will not "replace" the teacher, and certainly will not lower the cost of instruction significantly.
9. Are costly, whether the equipment and materials are purchased or rented; and, therefore, may be difficult to justify.
10. Suffer from lack of *really good* programs, for many of those now available were produced on a "crash" basis to meet a market demand, and, therefore, may be of questionable value.

In summary, programed learning is a new tool in educational technology. Though promising, it is not a panacea for many educational problems.[29] Junior college administrators and teachers should be alert to its promises and wary of its pitfalls; they should keep abreast of developments in the field,[30] and if possible, should participate in one or more research projects in the new technique every year. Only from experimental data gathered over wide geographical areas and from many subject matter fields, will an objective evaluation of programed learning be made possible.

EDUCATIONAL TELEVISION

Technically, educational television (ETV) offers two kinds of instructional possibilities, *open-circuit television*, reaching broad community audiences with both formal and informal programs; and *closed-circuit television*, usually for on-campus instruction.

Open-circuit television involves operation of an actual TV station, which can be picked up on any receiver, or the use of limited time on commercial or educational stations. Because of the prohibitive costs, only large and well-financed districts can plan for open-circuit television programing. Some colleges have used time effectively on both commercial and non-commercial stations to teach courses and offer enrichment programs. The Chicago Junior College system pioneered with its TV College over educational station WTTW, a program now firmly established.[31]

Closed-circuit television, however, is a more feasible approach for many junior colleges. A modest closed-circuit ETV installation can be put into operation for an initial outlay of perhaps $150,000, with an annual operating budget of from $25,000 to $40,000.

Such a system should have facilities and staff to—

1. Televise lectures from the campus studio or from lecture halls, and show them at a number of locations (student center, dormitories, special TV viewing rooms).
2. Pick up programs from the commercial networks (when legally permissible) and show them on campus receivers.
3. Televise motion picture films.
4. Televise programs from video-tape or kinescope recordings.
5. Record video-tapes from live programs for future use.

Weekly program schedules should be published in the campus newspaper and posted near receivers. For maximum effectiveness, there should be flexibility of programing so that several programs can be shown simultaneously at different locations. For example, a physics lecture-demonstration may be routed to several monitor screens while a video-tape recording on automation is received by an electronics class, and a network broadcast on a news event is being viewed by a social problems class.

Adequate space and equipment are essential. Equipment needed would include cameras, TV receivers, video-tape and kinescope recorders, a film chain, studio technical instruments; and cables, circuits, and connections. Personnel required would include a producer, electronics and audio-visual technicians, and a secretary-receptionist for the studio.

Closed circuit ETV has many applications for technical education. It can—

1. Bring industry to the students every week.
2. Give a "front row seat" to all students in a large lecture section by televising close-ups of the instructor and demonstrations of equipment.
3. Provide for re-runs of lectures or lab demonstrations for slower learners, for review and drill, or for students who were absent.

[29] For a highly critical view of programed learning see Mayer, Martin. "Last Chance for Our Schools." *Saturday Evening Post*, September 14, 1963.

[30] Two relatively new journals in the field are: (a) *The Journal of Programmed Instruction*, published by the Center for Programmed Instruction, Inc., 365 West End Avenue, New York, New York; (b) the *NSPI Journal*, published by the National Society for Programmed Instruction, Trinity University, 715 Stadium Drive, San Antonio, Texas.

[31] See Erickson, Clifford G., and Chausow, Hymen M. *Chicago's TV College*. Final Report of a Three-Year Experiment. Chicago: Chicago City Junior College, August 1960.

4. Show the work of technicians on the job in industrial and scientific laboratories, clarify working relationships, and delineate the skills and knowledge expected of technicians.

Closed-circuit ETV does indeed have promise, but it is not an answer, in itself, to technical education problems. In view of its very heavy financial requirements the returns on the investment must be carefully evaluated and weighed against the outcomes of an equal expenditure of funds and energy on other techniques and facilities before a decision is made to install ETV. As with any innovation, cooperative faculty planning and interest are essential. Many faculty regard ETV as a poor substitute for traditional classroom teaching, as indeed it is, if it is not well done. Someone has said: "Mark Hopkins at one end of a log with students at the other end and a coaxial cable in between is poor teaching." Many faculty will agree with this position, and their suspicions will prove correct unless the new medium is planned carefully, used wisely, and evaluated continuously.

A LEARNING FORUM

Another innovation is being used with considerable success by some junior colleges. This third approach attempts to bring many educational technologies to bear on the problem of teaching large numbers of students simultaneously in an especially equipped lecture hall which might be called a *learning forum*. Reaching greater numbers of students with qualified faculty is infinitely better than "keeping class size down" by adding unqualified persons to the teaching staff. The first requisite for this innovation is a number of courses with large enrollments necessitating several sections of the same course. The second requirement is a lecture hall large enough to seat two or three hundred students. The third requirment is the presence on the faculty of master teachers who would rather present a lesson *once* to 150 students than give the same lecture *five times* to sections of thirty students.

Given these conditions, the next step is to plan the learning forum so that every avenue to teaching and learning can be exploited. A few of the necessary steps are listed, to suggest the scope of the over-all development.

The forum room should be planned like a theater in terms of acoustics, seating, and lighting; and it should contain the best quality audio-visual equipment. Closed-circuit educational TV should be used, with receivers which can be viewed by all students in the room. Technicians should be provided to operate audio-visual and television equipment.

Participating faculty members should be aided by a producer in planning presentations. Rehearsal time should be allocated for the forum room, and faculty load should be reduced for those who participate in the learning forum presentations.

The learning forum places a master teacher in a classroom in personal contact with students, supported by every device which possesses potential for aiding learning. It makes use of the *team teaching approach*, and is therefore in keeping with the education and utilization of technicians. The teacher concentrates on teaching and assigns the supporting role to others. (New and/or inexperienced faculty should be encouraged to attend the forum presentations, both as an in-service professional experience for themselves and to acquire background for their assignments in charge of quiz sections, laboratory sections, and discussion sections.)

SECTION VI

Recruitment, Selection, Guidance, and Placement

Planning and operating programs of semiprofessional and technical education demand administrative and faculty effort of considerable dedication and effectiveness. "Quality within diversity" is not a goal for a faculty which enjoys the simplicity of the *status quo*. Once a faculty has committed itself to the diversity characteristic of the community college, change is the normal order of events; curriculum development becomes continuous; and evaluation takes place on a continuing basis as the result of "feedback" from graduates, from advisory committees, and from the community.

Intensive curriculum planning and excellent instruction, important as they are, do not, of themselves, insure a successful occupational education program; for they tend to reflect the needs of industry and business and the competencies of the faculty, while neglecting to consider the raw material in the educational process—the students themselves. Four factors related to the students are of special importance—recruitment, selection, guidance, and placement.

Recruitment—because more persons are needed for semiprofessional and technical jobs than are now being educated.

Selection—because not all students who apply for enrollment in technical curriculums have the ability to succeed.

Guidance—because choosing a career, and an educational program leading to it, are critical decisions in the lives of young people.

Placement—because the very essence of occupational education is the placement and success of graduates on the job.

STUDENT RECRUITMENT

Semiprofessional and technical personnel are needed in greater numbers than ever before. The fact is, however, that most semiprofessional workers and technicians today were, when they were high school students, planning on professional careers. The recognized professions (though they comprise only 11 per cent of the labor force) are the rather ill-defined goal of over 50 per cent of high school students. Pressures from parents, fellow students, and from high school teachers and counselors motivate thousands of high school youngsters to elect the academic program when their interests and abilities actually lie in more practical fields.

Junior colleges, too, face the same status problem. Nationwide the average junior college freshman class, *even with and after testing and counseling procedures*, shows a predilection for the "transfer" programs. Medsker[32] reports that two-thirds of junior college freshmen choose the academic or transfer program. The lack of realism in many of these choices is evident in the fact that only about one-third of junior college freshmen ever matriculate in a senior college for upper division work.[33]

The public junior college has been a terminal institution for nearly 70 per cent of its freshmen students. How well has it met the educational needs of those who elected the academic program but did not succeed in it? A related, but equally important question is, what can be done to increase significantly the precentage of students who will choose a realistic goal—occupational education in the junior college? In a status-conscious society how can we give more status to the semiprofessional, technical, and skilled occupations and to the educational programs for these occupations? Herein lies the solution to the problem of student recruitment.

Techniques in recruitment vary from one community and region to another. Indeed, some regions in a few states report little or no difficulty with recruitment for technical programs, but this situation is not commonplace.

Some suggestions for attacking the related problems of status and recruitment will be given, within the framework of several assumptions. The assumptions are as follows:

1. A fair-sized (1,000 or more regular day students) community junior college in a region served by several comprehensive high schools.
2. A comprehensive program of occupational education (semiprofessional, technical, and skilled levels) as well as lower division programs for transfer.
3. A state or region where public higher education is available to all high school graduates at nominal cost.

---

[32] Medsker, Leland L. *The Junior College: Progress and Prospect.* New York: McGraw-Hill Book Co., 1960. p. 97.

[33] *Ibid.*

4. An industrial and business economy which offers employment to significant numbers of semiprofessional and technical personnel.
5. A reasonable budget for recruitment purposes.

The following techniques have proved their worth at many junior colleges:

Technique No. 1—Tell the "community college story" with pictures.

Prepare a professional quality color slide film presentation on the occupational education program. Write a script for the production, record it on tape, and key an automatic slide projector with the taped commentary. Then give the program the widest possible showing in the community—before service clubs, PTA's, church groups, youth groups, union meetings, employee associations, chamber of commerce meetings—using a well-informed and articulate faculty member to lead a discussion following the slide presentation.

These programs must be of professional quality, and they must be as smooth as a corporation sales meeting. You have an important message on education—be sure you tell it effectively to each of your many publics.

Add a new program each semester, until you have one on each of the occupational curriculums offered. Keep them up-dated and feature education as the bridge between man and his job.

Technique No. 2—Build status for "middle level" occupations.

Plan news stories and television programs featuring the work of technicians, secretaries, nurses, business data programers, health service workers, agricultural technicians, department store buyers, food and appliance demonstrators, and others in semiprofessional, technical, and skilled occupations. Inform the public about working conditions, salaries, and job opportunities in these fields. Create an image of the semiprofessions to balance the image of the professions held by the general public.

Technique No. 3—Build status for the occupational education program in your college.

Emphasize its requirements, the quality of the program, the high school preparation required for entrance, and the status of the associate degree. Develop the concept that these are college-level programs with an employment objective. Feature the recent graduates of your programs—their jobs and their salaries. Identify the college educational programs with prestige companies, with departments in companies, and with new and popular industries such as space research, automated operations, medical research, aviation, communications, electronics, and pharmaceuticals.

Technique No. 4—Interest high school teachers and counselors in occupational education.

Studies show that high school teachers and counselors rank equally with parents and friends in their influence over the career (and educational) choices of high school students. Creating understanding of college level occupational education among high school counselors and teachers is one of your most important jobs.

Invite them to the college campus for symposiums and workshops. Visit them on their campuses and try to understand their problems. Provide them with occupational information, career publications, and brochures on your occupational education programs. Give them specific information about the prerequisites for your courses and curriculums. Offer to send speakers from the college to talk to high school groups about occupations and the educational programs at the college.

Talk with high school staffs about the feasibility of a "third track" in high school—college prep curriculums whose objective is to prepare graduates for success in junior college occupational education curriculums.[34]

Technique No. 5—Provide a career day on campus for high school seniors every spring.

Divide the visiting students into interest groups and schedule short but meaningful group guidance sessions on occupations and on the programs the college offers. Make the groups small enough so that discussion is possible. Use visual aids! Use faculty and junior college students to the best advantage. Tour the laboratories, classrooms, and shops where instruction is in progress.

Invite members of lay advisory committees or other business and industrial employers to present brief remarks and participate in group discussions on careers. Select people who will stress the importance of post-high school occupational education.

Career days should be well planned by faculty and students. Nothing should be left to chance. Visitors will judge the college by their experiences on campus during the day. The image they take way must be one of quality within diversity.

[34] *The Richmond Plan.* Report of a Pre-Technology Program for the "Average Learner." San Francisco: Cogswell Polytechnical College, 1962.

Technique No. 6—Use the mail for educational purposes.

Send a letter of congratulation to every high school graduate in the college attendance area. Encourage them to consider further education at the college of their choice. And include selected brochures on your college—its occupational education programs and its "transfer" programs. Invite them to visit the campus and talk over their plans with a counselor.

The recruitment effort here proposed is a continuous effort. Several years are required before encouraging results are obtained. But adaptations of these techniques to your community will bring results in good time—results which may in time approximate these statistics:

1. Sixty per cent of high school graduates will "go on to college," in contrast with the 30 per cent which is common in many communities today.
2. Half or more of those who enroll on your campus will actually elect an occupational education program at the outset.
3. Most of the "borderline" transfer students will move willingly to an occupational education objective after one or two semesters, if success is not achieved in academic courses.

STUDENT SELECTION

The "open door college" can and should have closed doors to some of its curriculums. These "curriculum doors" open only when the student turns the key of proper preparation. For some junior college students, the first freshman semester may be spent in building a sound educational foundation for the work demanded by the curriculum which has been tentatively chosen in conference with a counselor.

Admissions Policies. Many junior colleges admit any high school graduate or any adult who can "profit from the instruction." Others have developed admissions criteria similar to those in use by universities and liberal arts colleges. Between these extremes are many institutions whose admissions policies are not exactly "open door," nor are they highly restrictive. Typical of this group are those colleges which require a "C" average from high school.

Some "open door" colleges in recent years are adopting a "probation at entrance" admissions plan for all students whose high school grade average is below "C." Probationary students who earn a 2.0 grade point

average (on a 4-point scale) in the first semester of a "general" or "opportunity" program, move off probation and may move into one of the regular curriculums. Failure to make a "C" average in the general program may result in dismissal from the college.[35]

But regardless of the policy of *admission to the college*, admission to a particular curriculum or to specific courses should be based upon evidence which would indicate a fair chance of satisfactory performance in the program or course. This section will discuss some criteria which have been used with success by a number of junior colleges in selecting students for various occupational education programs.

Note: *The following guidelines are suggested procedures only, and are not intended as "rules" for selection. Each institution will set its own rules, as the collective wisdom of faculty and counselors is brought to bear upon the difficult problem of assisting students to set goals which are consistent with their abilities and interests.*

ENGINEERING AND INDUSTRY-RELATED TECHNICAL PROGRAMS

Rank in high school graduating class has been and still is one of the most reliable of predictive devices. Standardized achievement, aptitude, and interest tests should be used to supplement information from the high school record. Two of the more widely used standardized tests are the CEEB-SAT battery and the SCAT battery. Both produce raw scores which can be converted to percentile ranks on national norms for college freshmen; and both yield a "Q" (quantitative or mathematical) score and a "V" (verbal skills) score. The *Iowa Tests of Educational Development*, particularly Test Two, "General Background in the Natural Sciences" (ITED-2), and Test Four, "Ability to do Quantitative Thinking," (ITED-4) are both reasonably good predictors of performance in technology curriculums which are science- and/or mathematics-based.

No one selection criterion should be used alone. At least two, and preferably three, should be considered. High school rank in class, the

[35] See Dula, T. C. *Academic Probation and Suspension Policies and Practices in Public Junior Colleges.* Tallahassee: Florida State University, Office of Institutional Research and Service, 1961.

SCAT battery and ITED-4, "Ability to do Quantitative Thinking" constitute a group of three predictors which have been used with considerable success.[36] Raw scores on tests should be converted to percentile ranks on college freshmen norms, and the high school rank in class may be easily converted to a percentile.[37]

New students entering junior college and interested in the general field of engineering, science, or the related technologies might well be considered as a group to which the following very tentative selection criteria could be applied. (Test scores are, of course, just one factor to be considered. Noncognitive factors must also be taken into account.)

1. Students who are generally above the 70th percentile on freshmen norms and who have a "B" or better average in a high school math-science major probably should be encouraged to enter a pre-engineering or pre-science "transfer" program.
2. Students whose test records place them at or above the 50th percentile, and who have "C" or better grades in a "college prep" program (with significant mathematics and science work) from high school, are ordinarily good prospects for *semiprofessional* or *engineering technology* curriculums. A good standardized test for mechanical aptitude might well be given as a check on the other predictors.
3. Students who rank as low as the 20th percentile on college freshman norms and who have completed elementary algebra and/or plane geometry with grades of "C" or better, might be accepted for enrollment in technical curriculums of the *highly skilled* or *industrial technician type*. A mechanical aptitude test is again advised.
4. Students near the bottom of the percentile distribution and particularly those who present no significant science or mathematics competencies from high school should probably be placed in a one-semester probationary program designed to test their suitability for technical education, and to bring their mathematics and communications skills up to a level which might enable them to succeed in a regular college level occupational program. Or, if the college offers programs for the skilled and semiskilled occupations, these students might better be encouraged to enroll in one of these curriculums.

In all cases, the "Q" (quantitative) scores should be given greater weight in selecting technician students, but unusually low "V" scores should ring an alarm bell, since serious reading deficiencies may be indicated in these cases. Specialized work in communications skills, and perhaps a reading improvement course, would be indicated in cases where low "V" scores are associated with satisfactory "Q" scores.

Carefully conceived and wisely operated selection procedures should make it possible to avoid the 50 per cent to 70 per cent attrition rates which have characterized a number of junior college technical education programs in the past.

OTHER SEMIPROFESSIONAL FIELDS

Similar procedures can be used to assist in the selection of students who will probably succeed in other semiprofessional curriculums. A few guidelines which have proved helpful at a number of junior colleges are listed below:

Business Education Curriculums

1. Secretarial (private secretary level)—in the top half of the high school graduating class. "V" scores at or above the 40th percentile on standardized tests. "Q" scores above the 25th percentile—college freshman norms.
2. Business management and accounting—in the top half of the high school graduating class. "Q" scores above the 40th percentile, "V" scores above the 30th percentile.
3. Business data programing—in the top half of the high school graduating class. "Q" scores above the 50th percentile, "V" scores above the 30th percentile.

Health Education Curriculums

1. Nursing (R.N.), medical technology, and dental technology—in the top half of the high school graduating class. Satisfactory performance in natural science aptitude tests. "Q" and "V" scores generally above the median of the college freshman class.

[36] See Los Angeles City School District. *Some Characteristics of Engineering-Technical Students in the Los Angeles City Junior College District.* Research Report No. 248. Los Angeles: the District, November 1962.

[37] Greenwood, R. Leroy. "Predicting Success in Technical Programs." *Technical Education News* 23: 22-23; December 1963.

2. Medical and dental office assisting—above the 40th percentile of the high school graduating class. "V" scores above the 40th percentile, "Q" scores at or above the 20th percentile.

Public Service Occupational Curriculums (such as law enforcement and fire service)

Above the 30th percentile of the high school graduating class. "Q" and "V" scores both at or above the 20th percentile on college freshman norms.

Agriculture Curriculums

1. Agri-business—essentially the same criteria as recommended above for business management and accounting.
2. Agriculture technology—essentially the same criteria as recommended above for "highly skilled" technicians in industry.

Home Economics Curriculums

Essentially the same criteria as recommended above for medical and dental office assisting.

LOWER QUARTILE STUDENTS

What about the many students whose over-all scholastic aptitude, as estimated from several tests and from high school grade standings, places them in the lower quartile of college freshmen? This is a very significant question, for the open door college has many of these.

The best answer, of course, is to provide a variety of educational programs in which these students *can succeed* and later take their place as a part of the skilled work force of the nation. Such curriculums are not the primary purpose of this Bulletin, but their omission here *does not in any sense imply that they should be neglected.* The community college cannot neglect the education and training needs of this group of young people. A variety of two-year, one-year, and short term curriculums, leading to competencies for employment in the skilled and semiskilled occupations, would seem to be needed for this group of students. General education must not be neglected, however, for it is frequently a deficiency in reading and writing skills or in elementary mathematics which turns the semiskilled worker into an unemployment statistic.

A FINAL WORD ON SELECTION PRACTICES

Despite the seeming emphasis on "cutting scores" in the above recommendations, it is emphasized that they must be applied with great care and with much flexibility. Aptitude measurement is far from an exact science. The wise counselor will use scores and percentiles as a *guide,* but he will not let them dictate his actions. Students are people, and people are continually confounding the experts. If there is a reasonable chance for success in a given case, the student should be given that chance.

GUIDANCE

All junior college students should have counseling services available to them both before and after registration and enrollment in classes. Guidance services are especially important for employment-bound students. A personnel folder should be made up for each student as he begins registration and enrollment, and it should be kept up to date during the period of his college attendance. The folder should contain, as a minimum—

- The student's high school transcript, his rank in his graduating class, and letters of reference from high school sources.
- The results of all standardized intelligence, aptitude, and achievement tests, with raw scores converted to percentiles on college freshman norms.
- The results of vocational interest tests with their profile interpretations.
- Anecdotal reports of conferences with the student and with his parents.
- His assignment to a curriculum and the proper notation as to his status —whether in make-up courses, on probation, or fully enrolled in the curriculum, without deficiencies.
- His class schedule of courses, and hours of class attendance for each semester.
- Grade reports and other periodic or casual reports from instructors.
- A record of part-time or full-time job experiences, with an evaluation by employers.
- A record of extracurricular activities.
- A cumulative record of courses completed, grades attained, and progress made toward meeting the requirements for the associate degree in the occupational field selected.

A weak spot in the guidance program of many junior colleges is the "first-point-of-contact" interview. Too often this "interview" is a hurried conversation at the registration counter, followed by a flurry of filling out forms and an assignment to a counselor on the basis of the *student's declaration* of educational and occupational goals. This procedure may be satisfactory for a few well-motivated and self-directed students, but for most the "first-point-of-contact" should be a searching, probing session with a professionally trained guidance counselor. The outcome of this interview can then influence the nature of the testing program and the assignment to the proper counselor for curriculum and course selection. As McDaniel [38] points out:

"Junior colleges enroll unusually large proportions of 'undecided' and 'vaguely decided' students. Career decisions must be made soon or time will be wasted. Frustration, failure, and dropout often result from lack of choice or wrong choice. Good choice is made difficult by inadequate information, faulty self-appraisal, peer influences, status values, family pressures, conflict with immediate needs."

Proper "first-point-of-contact" counseling can minimize the "frustration, failure, and dropout" to which McDaniel refers. Giving students a good start will materially reduce the counseling load later in the semester, and will enable the college to maintain its program of quality within diversity as it serves the needs of all its students.

The work by McDaniel [39] gives an excellent treatment of the subject of junior college guidance programs. Consequently this section will not deal in general principles, but will suggest, *from the viewpoint of the technical educator*, some specific ways in which guidance services for employment-bound students can be improved. The college administration should—

1. Recognize that educational advisement (the principal need of the transfer student) and vocational guidance (the immediate need of the employment-bound student) are quite different aspects of guidance.
2. Make a clear-cut distinction between counseling on personal and individual problems (which is the proper concern of guidance workers with a strong psychology background), and vocational guidance (which is the proper concern of persons who are qualified by both work experience and guidance training to advise students about careers).

   Employment-bound students generally realize greater value from the college guidance service when there is widespread faculty participation in counseling, rather than when all the counseling is done by a few full-time professional guidance workers. When technician students can be advised by a counselor who has had actual engineering or industrial experience; nursing students by a nursing educator; business students by a counselor with recent

[38] McDaniel, J. W. *Essential Student Personnel Practices for Junior Colleges.* Washington, D.C.: American Association of Junior Colleges, 1962. p. 20.
[39] *Op. cit.*

business management or business office experience—then *mutual decisions* about career and curriculum choices can be made with much greater satisfaction to the student than is possible in counseling situations where neither the student nor the counselor really knows very much about the world of work.

3. Maintain a complete and current collection of occupational and career information. In addition to a file in the library "occupations area," display the material attractively on bulletin boards and tables in several different locations. Change the displays weekly—feature occupations or families of occupations. Provide chairs and tables where students can use the materials. Relate the occupational information to the curriculums and courses offered on campus. Most junior colleges could improve their occupational information services immensely if funds and personnel were provided to do the job.
4. Provide an orientation course for all employment-bound students during their first semester, for the purpose of continuing group guidance. Students' test scores can be interpreted, occupational information can be studied in detail, and discussions (with guests from business and industry) can be held to bring career aspirations and educational objectives into sharper focus.
5. Provide enough counselor time to allow for unhurried discussions of career aspirations and academic ability. Matching these two is time-consuming. It hardly seems likely that a young man or woman who is already eighteen and has graduated from high school without choosing a career, can now decide in a fifteen-minute interview.

   Counselor time is expensive, of course, but starting students right, and checking on their progress periodically, are fully as important as providing high quality instruction. "Frustration, failure, and dropout" are expensive too, not only in terms of money, but in terms of the lost self-esteem and reduced value to society of the young people affected.
6. Provide the same caliber of guidance services for adult (evening) students as for regular day students. Wasted effort is just as inexcusable at 9:00 p.m. as it is at 9:00 a.m. Permitting adults to enroll indiscriminantly in evening courses and curriculums is just as indefensible as permitting day students to do so. It may be true that employed adults bring a more mature attitude to their work, but it is also true that they are "rustier" in basic subject matter; they have forgotten how to study; and they have home and civic responsibilities which may militate against scholastic achievement. Getting them started at the right level and at the correct pace is the key to their ultimate success.

The junior college which cannot "afford" quality guidance services for its adult (evening) students probably cannot afford to offer an evening program at all.

PLACEMENT AND FOLLOW-UP

Placement is the keystone in the occupational education structure. It should not be left to chance, nor should it be entrusted entirely to some agency outside the college. The assistance of other placement agencies (public and private) may be welcomed, but the major directive effort should be centralized in one person or office at the college. Coordinators, department chairmen, counselors, and faculty members may (and should) assist in placement, but the over-all effort must not be incidental and uncoordinated. Industrialists and businessmen seeking employees should be able to deal with one office at the college. Placement records (student personnel files and job listings) should be centralized where they may be kept up to date, and this office, under the direction of a trained placement official, should provide students, graduates, and potential employers with efficient and courteous service.

It is especially important that the junior college which operates semiprofessional and technical education programs have an effective placement bureau. Graduates of these programs move into relatively new occupational streams where channels for job placement are not yet well established. The professional occupations on the one hand, and the trade and craft occupations on the other, are served by public and private agencies accustomed to dealing in these well-established job categories. In general these same agencies are not accustomed to serving the semiprofessional worker, and by the same token, employers with "middle level" job openings do not normally seek these employees through existing agencies. Junior college graduates and local employers, too, will be best served if the college operates its own placement bureau.

Concept and practice for the junior college placement office have been throughly treated in another AAJC publication.[40] Consequently, this discussion will be brief and pointed toward placement services for graduates of (or students in) occupational education programs. Operating details will not be discussed since they are very effectively treated by Mohs in the publication just referred to.

The following guidelines are suggested for the operation of a placement bureau in a community junior college where occupational education is a recognized function:

1. Centralize placement activities in a placement office under the direction of a trained placement official.
2. Encourage placement efforts by faculty and staff in a planned and orderly manner, but with coordination of the total effort in the placement office.
3. Dedicate the efforts of the placement office to the real job—*career placement*. If budget and staff permit, the service of *casual placement* may be rendered to students, but avoid letting "the tail wag the dog."[41]
4. Conduct an energetic (and continuous) campaign of information about the placement office until every business, industry, and agency in the region knows of its existence and purpose.
5. Cooperate with and enlist the assistance of local employment agencies, both public and private.
6. Keep records on students and job openings current—if not day by day, at least week by week.
7. Match students to jobs so that mutual satisfaction (employer-employee) will result. The reputation of the placement office, and indeed, the reputation of the college's occupational education program depends on the integrity and skill of placement personnel in this regard.
8. Prepare the student for his job interview. Get him ready to face his prospective employer by "training" him in the placement office.
9. Appoint a director of placement who will get out into the community and locate job openings like a trained reporter sniffs a news story. An "office recluse" waiting for the telephone to ring will not be very effective.
10. Make use of all the citizens' advisory committees in the placement effort. An annual "advisory committee night" in the spring (dinner, program, visits to regular classes and laboratories which have been moved to an evening hour for "advisory committee night") is often extremely productive.
11. Make placement important on campus. Use bulletin boards, display racks, photographs of former students at work on their jobs,

[40] Mohs, Milton C. *Service Through Placement in the Junior College.* Washington, D.C.: American Association of Junior Colleges, 1962.

[41] Definitions: *Career placement*—placing graduates (or students completing an occupational curriculum) on jobs for which they were educated and trained in the college. *Casual placement*—placing any and all students on part-time and summer jobs, usually unrelated to their course of study, for the sole purpose of "making some extra money."

feature articles in the campus newspaper. Bring last year's graduates back occasionally to talk to freshman orientation sections about their education at the college and their work on the job. Get the local city and county newspapers to run articles on graduates working at interesting jobs.

FOLLOW-UP PROCEDURES

Placement and follow-up should be inseparable. Exit interviews should be held with each student just before graduation (or completion of his program), and the follow-up process should be initiated at that time. The reasons why the college desires to follow up on its graduates should be explained. A "permanent" address should be obtained. Samples of the follow-up questionnaires which he might receive during the next year or two should be shown and explained to the student.

Follow-up programs are often too abortive to be of any real value. A typical procedure is for a junior college to goad itself into a mammoth follow-up study once every five to ten years, publish the report, and then more or less forget about it. The report of such studies may "add to the literature," but they do not furnish the continuous "feedback" which the college must have for curriculum revision and devolpment. Graduates of semiprofessional and technical programs should be followed up just as tenaciously as are students who transfer to four-year colleges and universities.

In soliciting information from the graduates themselves, one year, two or three years after graduation, such data as the following might be requested:

- Starting salary, and record of increases.
- Promotions received, and paths to further advancement.
- The actual demands of the job with respect to mathematics, physics, technical specialty knowledge, and background in general education.
- The working conditions. Hourly pay, or salaried? Working in research, design, production, maintenance, testing?
- Relationship to professional persons on the job, and also to craftsmen and trade-level workers.
- Opinion on education and training received at the college. Wherein was it excellent? Adequate? Inadequate?
- Suggestions for improvement of certain phases of the college program: in the technical specialty courses; in the supporting science and mathematics courses; in the general education courses; in guidance, counseling, and placement services.

In soliciting information from employers, aim at involving two levels of management—the first-line supervisor level, and the plant manager or personnel manager level. Make sure that these two persons answer independently of one another, so that cross checks and legitimizers can be used to advantage. Questionnaires sent to employers could solicit much the same information as that expected from the graduate himself, but the instrument would be organized differently. Personal interviews with employers should be held occasionally to explore in depth certain matters which can only be touched on lightly in a questionnaire survey.

Information from follow-up studies should be disseminated to coordinators, department chairmen, and instructors so that remedial action, if necessary, can be taken at once. The findings should serve as a major factor in curriculum changes from year to year. The director of placement, because of his key position between students and potential employers, should be a continuing member of the college's curriculum committee.

Follow-up studies, if their results are disappointing, will act as a spur for improvement. If the results are satisfying or complimentary, the studies can add status to the program. They will lend force to admonitions to students to remain until graduation. Published data from the studies will influence community opinion and engender local pride in the institution as a true community college. *Remember that technical education still has to be sold to the public at large.* Nothing sells like success, so when you have a success story, tell it effectively and tell it far and wide.

SUMMARY

Recruitment, selection, guidance, placement, and follow-up are not ancillary activities of a junior college program. They are *essential* to the entire educative process. Although any attempt to compare education with a business or industrial enterprise is at best only illustrative, it is interesting to contemplate the probable fate of a business enterprise if the functions of raw materials procurement, component specifications, quality control, and sales and market research were relegated to a position of secondary importance in the over-all scheme of operations. Without effective programs of recruitment, selection, guidance, placement, and follow-up, a technical education program awaits the same fate—ignominious failure.

SECTION VII

SOURCES OF ASSISTANCE AND INFORMATION

"New directions in junior college education" is a good topic or theme for a workshop or convention; it can serve as a slogan for conducting an institutional self-study; and it could well be the theme of a citizens' community survey. But actually changing to the new course and ringing up full speed ahead involves more than mere sloganeering. Lip service to the needs of middle level youth has not yet created a comprehensive community college. Determination born of conviction, faculty action spurred by administrative leadership, trustee planning backed by citizen support, people and parents honestly concerned about *all youth*—these are the factors which combine to produce the comprehensive junior college. And the catalytic agent for this combining reaction is the college president.

Once the decision has been made (hopefully, as a result of faculty action) to offer a broad program of occupational education, the need for information, assistance, advice, and documentation is immediately felt. Information to support and document the decision may be needed to win the support of the governing board. Graphic and/or pictorial presentations may have greater impact with citizens' groups and with high school students; while detailed factual information is needed for curriculum and facilities planning.

This concluding chapter will present a compilation of sources of information and assistance which may be helpful to junior college faculties planning new programs of occupational education.

A SELECTED, ANNOTATED BIBLIOGRAPHY OF BOOKS, STUDIES, AND SURVEYS

American Association of Junior Colleges. *Junior College Directory*. Washington, D.C.: the Association, 1964.

American Council on Education. *Man, Education, and Work*. A report of a study on the need for occupational education in colleges, sponsored by the American Council on Education; Grant Venn, consultant. Washington, D.C.: the Council, 1964.

The study committee consisted of leaders from education and industry from a wide geographical area. Educators from high schools, community colleges, and universities assisted in preparing the report.

Bogue, Jesse Parker. *The Community College.* New York: McGraw-Hill Book Co., 1950.

A comprehensive work by a former executive secretary of the American Association of Junior Colleges. The occupational education function of the community college is given considerable attention.

Barlow, Melvin L. *A Survey of Junior College Work Experience Education Programs.* Los Angeles: University of California at Los Angeles, Division of Vocational Education, 1963.

Describes the work-study programs being conducted during 1962-63 by eighteen California junior colleges.

Barlow, Melvin L., and Schill, William John. *The Role of Mathematics in Electrical-Electronic Technology.* Los Angeles: University of California at Los Angeles, Division of Vocational Education, 1962.

Describes the results of a study made in the electronics industry and in forty-five California junior colleges, to determine the expected mathematical abilities of technicians in the industry.

Brady, James T., and Others. *Teamwork in Technology: Managing Technical Manpower.* Scarsdale, N.Y.: Technician Manpower Associates (P.O. Box 158).

An authoritative study of the education and utilization of technician manpower. Emphasis is on technicians in industry.

Brandon, George L. *Twin Cities Technicians.* East Lansing, Mich.: Michigan State University, College of Education, Department of Vocational Education, January 1958.

A study of technician needs and training facilities in two Michigan cities.

California State Department of Education. *A Study of Technical Education in California.* Department Bulletin, Vol. 23, No. 7. Sacramento: the Department, 1959.

A report of a study made by Herbert S. Wood. Reviews a ten-year period of development, and makes recommendations for future action. Gives especial attention to the role of the public junior college.

———. *Business Data Processing—Technical Courses.* Bureau of Business Education, Publication No. 105. Sacramento: the Department, 1962.

An analysis of the technical and supporting technical courses recommended for a two-year junior college program in business data processing.

———. *Mathematics and Science Competencies for Technicians.* Department Bulletin, Vol. 29, No. 12. Sacramento: the Department, 1960.

A report of a survey made in the chemical and electronics industries of California of the actual "need to know," by working technicians, of certain levels and concepts of mathematics and science.

———. *Technicians in Agriculture.* A report of a research project in agricultural technology—California State Department of Education and Modesto Junior College. Sacramento: the Department, 1962.

An analysis of the work of the agricultural technician and a suggested pattern of courses for a two-year junior college curriculum.

California State Department of Education and the University of California at Davis. *Training Requirements of Workers in the Production and Distribution of Nursery Plants.* Sacramento: the Department, 1959.

The results of a state-wide study of the employment practices of nurseries and greenhouses, with implications for junior college agriculture programs.

Dauwalder, Donald D. *Education and Training for Technical Occupations.* Part I—A Study of Industries and Schools in San Fernando Valley, California, Relating to the Education and Training Required for Technicians and Related Occupations. Part II—A Guide for Curriculum Development and Student Counseling. Los Angeles: Los Angeles City School District, Division of Extension and Higher Education, 1961.

A comprehensive and intensive survey of technical occupations in a metropolitan area. One of the best sources of information available for colleges planning to initiate or expand occupational education programs.

Deterline, William A. *An Introduction to Programed Instruction.* Englewood Cliffs, N.J.: Prentice-Hall, 1963.

Treats psychological theories of learning and discusses the relationship between the teacher, the teaching machine, the programed material, and the student.

Diebold, John. *Automation.* New York: D. Van Nostrand Co., 1952.

An early appraisal of the automation movement by the man who is credited with coining the word, "automation."

Drucker, Peter F. *America's Next Twenty Years.* New York: Harper and Brothers, 1957.

A look into the future with implications for education, industry, and politics.

Employment Security Commission of North Carolina. *North Carolina Study of Skilled and Technical Manpower.* Raleigh, N.C.: Bureau of Employment Security Research, 1962.

A definitive manpower study of the state, with especial emphasis on the utilization of technicians and future needs for technicians and skilled workers.

Engineering Extension Service. *Survey of Technical Occupations.* College Station, Tex.: Texas A & M College, 1959.

Report of a state-wide survey of technical occupations in Texas.

———. *Technician Requirements in Principal Industrial Areas of Texas.* College Station, Tex.: Texas A & M College, 1959.

The report of a careful study of technical occupations in a key industrial state.

Fine, Benjamin. *Teaching Machines.* New York: Sterling Publishing Co. (419 4th Avenue), 1962.

A survey of attitudes toward self-instructional devices.

Florida State Department of Education. *Administration of Technical Education in Florida.* Tallahassee: the Department, 1958.

Describes procedures for planning programs. The community occupational survey, curriculum planning, selection of instructors and students.

———. *Technical Education, Technicians for Florida's Industries.* Division of Vocational and Adult Education, Bulletin 79D-1. Tallahassee: the Department, 1959.

Reviews the development of technical education curriculums in Florida's junior colleges, with especial attention to the needs of industry in that state.

Fry, Edward. *Teaching Machines and Programed Instruction: An Introduction.* New York: McGraw-Hill Book Co., 1963.

A survey of the programed instruction movement useful to administrators and faculties wanting to get started in the field.

Gleazer, Edmund J., Jr., editor. *American Junior Colleges.* Sixth edition. Washington, D.C.: American Council on Education, 1963.

Gleazer, Edmund J., Jr. *A New Social Invention: The Community College, What It Is.* Washington, D.C.: American Association of Junior Colleges, 1962.

Green, Theodore M. *A Liberal Christian Idealist's Philosophy of Education.* Modern Philosophies and Education. Chicago: National Society for the Study of Education, 1955.

The author makes the point that in a "truly liberal academic community" vocational and occupational subjects are just as honorable and valuable as the so-called intellectual disciplines—that they should be taught in "a spirit of deep social concern for the needs of others and for the common good."

Henninger, G. Ross. *The Technical Institute in America.* Carnegie Series in American Education. New York: McGraw-Hill Book Co., 1959.

History, development, and current status of the technical institute movement in America.

Kansas State Board for Vocational Education. *The Training Needs of Highly Skilled Technicians.* Topeka: the Board, November 1959.

A report of a state-wide study of the utilization of technicians and their education and training needs.

King, Sam W. *Organization and Effective Use of Advisory Committees.* U.S. Depart- of Health, Education, and Welfare, Office of Education. Washington, D.C.: Government Printing Office, 1961.

A valuable treatise on the importance of lay advisory committees to programs of technical and vocational education.

Los Angeles City School District. *Some Characteristics of Engineering Technical Students in the Los Angeles City Junior College District.* Research Report No. 248. Los Angeles: the District, 1962.

A study of factors related to success in pre-engineering and engineering technology programs in a large city junior college district.

McDaniel, J. W. *Essential Student Personnel Practices for Junior Colleges.* Washington, D.C.: American Association of Junior Colleges, 1962.

A graphical and pictorial account of the guidance function in the junior college.

Medsker, Leland L. *The Junior College: Progress and Prospect.* New York: McGraw-Hill Book Co., 1960.

A scholarly appraisal of the junior college movement in America, growing out of research studies conducted over a decade.

Mohs, Milton C. *Service Through Placement in the Junior College.* Washington, D.C.: American Association of Junior Colleges, 1962.

A comprehensive treatment of the function of placement in the junior college.

National Education Association. *Automation and the Challenge to Education.* Proceedings of a symposium sponsored by the Project on the Educational Implications of Automation of the NEA; Luther H. Evans, director. Washington, D.C.: the Association, 1962.

A collection of papers by national authorities in the fields of education, economics, sociology, and industrial relations.

———. *No Room at the Bottom—Automation and the Reluctant Learner.* Proceedings of a symposium held in St. Louis in August 1962, sponsored by the Project on the Educational Implications of Automation of the NEA; Luther H. Evans, director. Washington, D.C.: the Association, 1963.

A collection of the papers presented by national authorities in the field of motivational research, bearing on the problem of the slow learner.

National Health Council. *Health Careers Guidebook.* New York: the Council (1790 Broadway), 1955.

Contains career information and educational guidance information on 150 different occupations in the health field. Many of these occupations are at the semiprofessional and technical levels.

National Science Foundation and U.S. Department of Labor, Bureau of Labor Statistics. *The Long-Range Demand for Scientific and Technical Personnel.* Bulletin NSF 61-65. Washington, D.C.: Government Printing Office, 1961.

The best single source of information on long-range projections of need for scientific and technical manpower.

New York State Department of Education. *Planning for College in New York State.* Prepared by Kenneth T. Doran, associate in higher education. Albany, N.Y.: the Department, 1959.

Information for those planning to attend college in New York. A detailed list of semiprofessional and technical curriculums in New York's community colleges and technical institutes is included.

New York State Department of Labor. *Jobs 1960-1970: The Changing Pattern.* Albany, N.Y.: the Department, 1960.

Manpower and technological change in New York State.

President's Committee on Education Beyond the High School. *First Report to the President* (Eisenhower). Washington, D.C.: Government Printing Office, 1957.

The community junior college and its occupational education programs receive much attention in the report of this distinguished group.

———. *Second Report to the President* (Eisenhower). Washington, D.C.: Government Printing Office, 1957.

Recommendations of a national committee composed of citizens of wide experience for all-out expansion of educational opportunities at the post-high school level. Occupational education, and the community college's role in it are stressed.

Schramm, Wilbur; Lyle, Jack; and Pool, Ethiel de Sola. *The People Look at Educational Television.* Stanford, Calif.: Stanford University Press, 1963.

An evaluation of the performance of nine representative educational television stations.

Smith, Harold T. *Education and Training for the World of Work.* A Vocational Education Program for the State of Michigan. Kalamazoo, Mich.: The W. E. Upjohn Institute for Employment Research, 1963.

Contains recommendations for a state-wide plan for vocational education, including recommendations for the role of the community college in technical education.

Streloff, Alexander N. *Guide to Public Relations for Junior Colleges.* Burlingame, Calif.: Southwestern Publishing Co., March 1961.

An excellent treatment of the subject—could serve as a guide to establishing an office of public relations.

Syracuse Board of Education. *Industrial Technicians for Greater Syracuse.* Syracuse, N.Y.: the Board, 1960.

An excellent "spot survey" on the need for technicians in a highly industrialized metropolitan area.

Teal, Gilbert E., editor. *Programed Instruction in Industry and Education.* Proceedings of the Institute on Programing, Stamford, Connecticut, 1961. Stamford, Conn.: Public Research Service, 1963.

A report of a workshop on programed instruction, in which many facets of the movement are examined.

The American Society for Engineering Education. *Characteristics of Excellence in Engineering Technology Education.* James L. McGraw, Project Director. Urbana, Ill.: the Society, 1962.

A report of a year-long study of engineering technology education with particular application to criteria required for accreditation by the Engineers' Council for Professional Development.

The Richmond Plan. Report of a study by the Richmond (California) Union High School District and the Cogswell Polytechnical College. San Francisco: Cogswell Polytechnical College, 1962.

The report is a study of the feasibility of pre-technical curriculums in high schools. Available from Cogswell Polytechnical College, San Francisco.

Thornton, James. *The Community Junior College.* New York: John Wiley & Sons, 1960.

A comprehensive treatment of the two-year college, with the "community college philosophy" clearly explained and forcefully documented.

U.S. Atomic Energy Commission. *Programs for Nuclear Educational Assistance.* Oak Ridge, Tenn.: Oak Ridge Institute of Nuclear Studies, 1962.

Describes loans, grants, equipment, speakers, and planning services available to colleges.

U.S. Department of Health, Education, and Welfare, Office of Education. *Area Vocational Programs.* Regulations for the Administration of Title VIII, NDEA of 1958, OE-80001. Washington, D.C.: Government Printing Office, 1960.

Sets up the framework within which state plans for technical education programs to be financed under the act may operate.

———. *Area Vocational Education Program Bulletins.* Suggested Two-Year Post-High School Curriculums. Office of Education, Division of Vocational and Technical Education. Washington, D.C.: Government Printing Office. The following are currently available:

No. 1—Electrical Technology—OE 80006
No. 2—Electronic Technology—OE 80009
No. 3—Mechanical Technology—OE 80019
No. 4—Electronic Data Processing—OE 80024

These bulletins are of considerable help to colleges planning technical programs in the fields listed.

———. *Occupational Criteria and Preparatory Curriculum Patterns in Technical Education Programs.* Office of Education, Division of Vocational and Technical Education, OE 80015. Washington, D.C.: Government Printing Office, 1962.

An excellent guide to curriculum planning for industry-related technical education programs. Discusses technician occupations, defines occupational requirements, and discusses criteria for educational programs.

———. *Education for a Changing World of Work.* Report of the Panel of Consultants on Vocational Education. Office of Education, Bulletin OE 80021. Washington, D.C.: Government Printing Office, 1963.

The official report of the President's (Kennedy) Panel of Consultants on Vocational Education.

———. *Technical Training in the United States;* Appendix I to *Education for a Changing World of Work.* Office of Education, Bulletin OE 20022. Washington, D.C.: Government Printing Office, 1963.

A scholarly study of technical education in the United States, prepared for the President's Panel on Vocational Education, written by the consultant for this project, Lynn A. Emerson.

U.S. Department of Labor. *Careers for Women as Technicians.* Women's Bureau, Bulletin 282. Washington, D.C.: Government Printing Office, 1961.

Points up the fact that women, too, are needed in the semiprofessional occupations. Identifies the job fields which hold greatest promise for women.

———. *Employment in the Atomic Energy Field.* Bureau of Labor Statistics, Bulletin 1297. Washington, D.C.: Government Printing Office, 1961.

An occupational survey of the new field of employment. The work of technical level personnel is thoroughly treated.

———. *Employment Outlook for Technicians Who Work With Engineers and Physical Scientists.* Bureau of Labor Statistics, Bulletin No. 1300-96. Washington, D.C.: Government Printing Office, 1962.

One in a series of occupational outlook reports. Educational requirements, the nature of technical occupations, and the employment outlook are described.

———. *Manpower, Challenge of the 1960's.* Washington, D.C.: Government Printing Office, 1961.

Presents with graphic impact, the manpower challenges of this decade. Emphasizes the importance of education for jobs at all levels.

———. *Manpower Report of the President.* Washington, D.C.: Government Printing Office, 1963.

A comprehensive report by the Department on manpower, requirements, resources, utilization, and training, prepared for the President's annual message to Congress.

———. *Occupational Outlook Handbook.* Career Information for Use in Guidance. Prepared by the Bureau of Labor Statistics. Washington, D.C.: Government Printing Office, 1963.

———. *Report on Research and Training Activities Under the Manpower Development and Training Act.* Prepared by the Office of Manpower, Automation and Training. Washington, D.C.: Government Printing Office, 1963.

A summary of the first year's operations under the MDTA. Technical level training and retraining programs are well described.

———. *Selected Occupations Concerned With Atomic Energy.* Bureau of Employment Security, Bulletin BES E-197. Washington, D.C.: Government Printing Office, 1961.

Summarizes the educational requirements and the job demands of many semiprofessional and technical level jobs in the field.

———. *The Challenge of Jobless Youth.* Report of the President's Committee on Youth Employment, W. Willard Wirtz, Chairman. Washington, D.C.: Government Printing Office, 1963.

Surveys the problem of youth employment and unemployment and the implications for education. Recommends a new and vital approach to vocational education, involving existing high schools, future technical-vocational schools, and existing and future community colleges.

University of Michigan, The. *Citizens' Survey of Washtenaw County Community College Possibilities.* Raymond J. Young, Director. Ann Arbor: the University, July 1963.

A citizens' participatory study of the feasibility of establishing a new comprehensive community college on a county-wide basis.

Washington State Board for Vocational Education. *Technical Education in Washington.* Olympia, Wash.: the Board, 1961.

A pictorial description of post-high school technical education in Washington, together with occupational information for career planning.

Wolfle, Dael. *America's Resources of Specialized Talent.* The Report of the Commission on Human Resources and Advanced Training. New York: Harper and Brothers, 1954.

The classic study of scientific, technical, and managerial manpower in the United States.

List of Associations, Organizations, and Agencies Interested in Semiprofessional and Technical Education

Administrative Management Society (formerly National Office Management Association)

1927 Old York Road, Willow Grove, Pennsylvania. Has as its purpose to stimulate interest in, raise the status of, and attract high caliber people to administrative management as a profession through cooperative programs with educational institutions at all levels.

American Association of Junior Colleges (AAJC)

1777 Massachusetts Avenue, N.W., Washington, D.C. 20036. Represents the nation's junior colleges, advancing their role in higher education. Publishes the *Junior College Journal* and has active commissions at work in many fields including areas of occupational education.

American Council on Education (ACE)

1785 Massachusetts Avenue, N.W., Washington, D. C. 20036. The representative voice of higher education in America. Has recently conducted a year-long study of college-level occupational education. (See bibliography, p. 93.)

American Dental Assistants Association (ADAA)

410 First National Bank Building, La Porte, Indiana 46350. Has as its object to promote the education of the dental assistant, to improve and sustain the vocation of dental assisting, and to contribute to the advancement of the dental profession and the improvement of public health.

American Dental Association, Council on Education

222 East Superior Street, Chicago, Illinois 60611. The official accrediting agency of the dental profession for programs in dentistry, dental hygiene, dental assisting, and dental laboratory technology. Likewise serves as an informational and consultative agency for educational institutions desirous of inaugurating programs in the above areas of study.

American Dental Hygienists' Association

100 East Ohio Street, Chicago, Illinois 60611. Makes available career information regarding profession and practice of dental hygiene; licensed and auxiliary to dentistry.

American Home Economics Association

Professional organization representing over 28,000 graduate home economists, engaged in education, business, extension, research, health, and welfare.

American Management Association, Inc.

135 West 50th Street, New York, New York 10020. A nonprofit educational organization dedicated to finding, developing, and sharing better methods of management. Makes available a bibliography of occupational information.

American Medical Association

535 North Dearborn Street, Chicago, Illinois 60610. Provides, without charge, information on preparing for medical careers through program kits of films, literature, exhibits, and loan fund sources.

American Personnel and Guidance Association

1605 New Hampshire Avenue, N.W., Washington, D.C. 20009. A professional organization dedicated to the improvement of standards of guidance and personnel work.

American Society of Clinical Pathologists

445 North Lake Shore Drive, Chicago, Illinois.

The American Society for Engineering Education

University of Illinois, Urbana, Illinois. Interested in the advancement of education in all of its functions which pertain to engineering and allied branches of science and technology, including the processes of teaching and learning, research, extension services, and public relations, also including the engineering technician.

American Society of Radiologic Technologists

537 South Main Street, Fond du Lac, Wisconsin. Provides career information on X-ray technology. Also provides list of approved schools.

American Technical Education Association, Inc. (ATEA)

22 Oakwood Place, Delmar, New York. Promotes technical education for qualified youth and adults.

American Vocational Association, Inc. (AVA)

1010 Vermont Avenue, N.W., Washington, D.C. Promotes vocational and technical education. Can provide information on the administration, philosophy, and interpretation of vocational and technical education.

Association for Higher Education, National Education Association

1201 Sixteenth Street, N.W., Washington, D.C. 20036. Publishes *Current Issues in Higher Education*, a yearbook of interest to junior college administrators, and represents the field of higher education.

Data Processing Management Association (DPMA)

524 Busse Highway, Park Ridge, Illinois. An international organization of management personnel interested in the education and training of persons for the data processing field. Awards certificates, publishes study guides, and lists audio-visual aids available.

Engineers' Council for Professional Development (ECPD)

345 East 47th Street, New York 17, New York. A federation of nine professional engineering societies. Its Committee on Education and Accreditation operates an accreditation program for engineering technology curriculums.

Office of Emergency Planning, Executive Office of the President

Washington 25, D.C. Assists in planning conferences on science, engineering, and technical manpower problems.

Institute for the Certification of Engineering Technicians

2029 K Street, N.W., Washington, D.C. 20006. Evaluates the experience and education of applicants as being qualified in the grade of Junior Engineering Technician, Engineering Technician, and Senior Engineering Technician and certifies them as such, but does not license them as in the case of professional engineers who are licensed by the various state boards.

Institute of Food Technologists

176 West Adams Street, Chicago, Illinois 60603. A professional society of food technologists.

National Health Council

1790 Broadway, New York 19, New York. Provides general information about careers in the health sciences.

National League for Nursing

10 Columbus Circle, New York, New York 10019. Assists junior and community colleges in establishing and improving nursing education programs through consultation, conferences, publications, and studies; provides testing services for use in evaluating nursing candidates and students, and for licensing graduate nurses; provides nursing careers guidance materials for recruitment of students.

National Society for Programmed Instruction

Trinity University, 715 Stadium Drive, San Antonio, Texas. Seeks to advance education and training by the collection, development, and diffusion of information concerning programmed instruction.

Project on the Educational Implications of Automation, National Education Association

1201 Sixteenth Street, N.W., Washington, D.C. 20036. Serves as an information clearinghouse in helping schools respond to the social impact of automation; holds conferences and publishes bulletins on automation and education.

State Departments of Education

Offer consulting services; reimburse certain vocational education programs; and receive and evaluate applications for National Defense Education Act, Title VIII grants for technician education and training.

Surplus Property Agencies

Locations of these available from State Departments of Education

The Center for Programed Instruction, Inc.

365 West End Avenue, New York 24, New York. Publishes the *Journal of Programed Instruction.*

U.S. Chamber of Commerce, Education Department

1615 H Street, N.W., Washington, D.C. Represents the interests of the business community in education, nationally and locally. Publishes materials on education.

U.S. Department of Labor, Bureau of Labor Statistics, Occupational Outlook Service

Washington, D.C. 20210. Publishes the *Occupational Outlook Handbook* which describes the employment outlook, educational and training requirements, promotional opportunities, and nature of work in nearly 700 occupations and 30 industries, and the *Occupational Outlook Quarterly,* which reports on new studies of subjects affecting the employment outlook. Maintains free mailing list of selected publications useful in guidance.

U.S. Department of Labor, Office of Manpower, Automation and Training

Washington, D.C. 20210. Administers the research program authorized by the Manpower Development and Training Act of 1962 in the field of manpower requirements, development, and utilization; assists in planning and evaluating occupational training programs established under the act; and conducts Demonstration Manpower Programs designed to illustrate how unemployed people with particularly difficult work problems can be trained for employment.

U.S. Office of Education, Division of Higher Education

Washington, D.C. 20202. Administers many government programs dealing with higher education. Gathers and compiles statistics and publishes directories and other publications dealing with higher education.

U.S. Office of Education, Division of Vocational and Technical Education

Technical Education Branch, Washington, D.C. 20202. Under the provisions of the Vocational Education Act of 1963, federal funds are made available through state

boards for vocational education on a matching basis for technical education programs under public supervision and control and which do not lead to a B.S. degree. It is the responsibility of the Technical Education Branch to cooperate with the states in the promotion and development of technical education programs.

Journals, Publications, and Newsletters

American Journal of Nursing

Published by the American Journal of Nursing Company, editorial offices 10 Columbus Circle, New York, New York. News about nursing and nursing education. Authoritative articles by leading nursing educators.

American Vocational Journal

Published by the American Vocational Association, 1010 Vermont Avenue, N.W., Washington, D.C. Carries some news and information on technical education, but major emphasis is at levels other than the junior college.

ATEA Newsletter

Published by the American Technical Education Association, 22 Oakwood Place, Delmar, New York. Contains current news and information on programs, people, and publications in the engineering- and industry-related technical fields.

Journal of Business Education

15 South Franklin Street, Wilkes-Barre, Pennsylvania. Publishes news and information and scholarly articles on business education.

Business Education World

McGraw-Hill Book Company, Inc., 330 West 42nd Street, New York, New York 10036. Professional magazine for business teachers and administrators at high school and college levels; emphasis is on improving classroom instruction.

Higher Education

The official journal of the Division of Higher Education, U.S. Office of Education.

Higher Education and National Affairs

Published by the American Council on Education, 1785 Massachusetts Avenue, N.W., Washington, D.C. 20036. A newsletter which carries up-to-date news on legislation and other matters affecting higher education.

Journal of Engineering Education

Published by the American Society for Engineering Education, University of Illinois, Urbana. Carries news about technical institute activities, but is primarily devoted to baccalaureate degree and graduate programs in engineering.

Junior College Journal

Published by the American Association of Junior Colleges, 1777 Massachusetts Avenue, N.W., Washington, D.C. 20036. The official magazine of the junior college movement in America. Publishes articles on all facets of junior college education.

The Dental Assistant

Published by the American Dental Assistants Association, 410 National Bank Building, La Porte, Indiana.

School Shop

Published by Prakken Publications, 416 Longshore Drive, Ann Arbor, Michigan. Traditionally a high school shop magazine, but is now moving rapidly into the field of industry-related technical education.

Technical Education News

Published by the McGraw-Hill Book Company, Inc., 330 West 42nd Street, New York, New York 10036. The best single source of current information on engineering- and industry-related technical education.

Consulting Services

American Association of Junior Colleges

Provides direct and specialized services to communities and organizations concerned with junior college development and provides assistance to existing junior colleges seeking guidance in specific areas of their continuing development. Maintains a Professional Advisory Services Program.

Junior College Leadership Program Centers

JCLP Centers and other universities with departments or centers whose work is related to occupational education and to the community junior college make avail-

able consultants in survey research and curriculum development. Centers are located at

Stanford University
Stanford, California

University of California
Berkeley, California

University of California
Los Angeles, California

Florida State University
Tallahassee, Florida

The University of Florida
Gainesville, Florida

Wayne State University
Detroit, Michigan

Michigan State University
East Lansing, Michigan

University of Michigan
Ann Arbor, Michigan

University of Texas
Austin, Texas

Teachers College, Columbia University
New York, New York

State Departments of Education

Many of these departments have both a junior college consultant and a technical education consultant.

U.S. Office of Education

Division of Higher Education

Division of Vocational and Technical Education

Consultants are available from these divisions to assist in surveys, curriculum development, workshop planning, facilities planning, etc.

The American Society for Engineering Education

Provides consultant services on curriculum development and other aspects of engineering education.

A Preliminary Study of Orange County's Junior College Occupational Curricular Needs.

North Orange County Junior Coll. District, Fullerton, Calif. Board of Trustees
Orange Coast Junior Coll. District, Costa Mesa, Calif. Board of Trustees
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Feb66 113p.

CURRICULUM PLANNING; *EMPLOYMENT TRENDS; *VOCATIONAL EDUCATION; EMPLOYMENT QUALIFICATIONS; TECHNICAL EDUCATION; *JUNIOR COLLEGES; EMPLOYMENT OPPORTUNITIES; *OCCUPATIONAL SURVEYS; ENROLLMENT TRENDS; ECONOMIC FACTORS; *JOB PLACEMENT; MANPOWER NEEDS; OCCUPATIONS; EMPLOYMENT OPPORTUNITIES
ORANGE COUNTY; CALIFORNIA; ORANGE COAST JUNIOR COLLEGE DISTRICT; COSTA MESA

National, state, and local statistical data were analyzed to identify the county's economic characteristics and occupational requirements in order to plan curriculum and facilities for 10 junior colleges needed in the area by 1980. National studies were used to identify the technology and manpower needs by 1970 for 39 selected industries. A sample survey was made of the major business and industrial employers of the county to obtain information about specific occupations. Enrollment trends in occupational curricula over the past 5 years are given for the two junior colleges in the county. The job market for terminal students of these colleges is reviewed. An over-all view of the economic forces that are shaping the population and industry characteristics of the county is given. Some conclusions were: (1) Work-experience education programs seem to offer considerable promise for junior colleges, (2) The continued use of advisory committees for the occupational curriculums is highly desirable, (3) The continuous study of economic trends in Orange County seems to be a necessity because of the county's rapid development, and (4) In the development of occupational curricula, the concept of families of related jobs should be considered. February 1966

INTRODUCTION

This study was undertaken for the North Orange County and Orange Coast Junior College districts to furnish them with information that might allow more effective planning for curriculum and facilities in the occupational or technical and vocational fields. Such planning becomes especially important at this time, as each district is now building or planning a new campus with the consequent need of constructing extensive and expensive specialized facilities for these fields. While an ordinary classroom may be easily adapted to teach English, mathematics or history, more specialized facilities are needed for such fields as merchandising, electronics, computer and dental services.

Even if no new facilities were being planned, this age of increasing tempo of technical change demands that attention be given to occupational trends as a basis for curriculum revision and for the advisement of students. The expansion of economy, and particularly the expansion of the sophisticated economic structure of the 'new' Orange County economy, is dependent upon the availability of well prepared potential employees. More important still is the advancement of the economic and cultural well-being of individuals who, through the acquisition of skills, understandings and abilities, can provide services that are both marketable today and adaptive to the changing needs of the future.

This preliminary study will deal with some qualitative aspects of the industry and occupational structure of Orange County. It will also attempt some quantitative measures which may be of value in developing an orderly allocation of occupational training to specific institutions. Regional planning in this regard is important. For instance, Orange Coast College now has a fine program in Oil Technology, the only one in the County. We have ascertained that there is a declining need for technicians in this area. Thus, other campuses of junior college districts should not attempt programs in this field. As the County develops the ten (10) junior college campuses which will be needed by 1980, it is strongly recommended that county-wide planning to identify the region's economic characteristics and occupational requirements (as illustrated by Oil Technology) be continued. By this means much expensive campus duplication can be avoided.

As one reviews the evidences of recent occupational change and employment trends, it becomes apparent that to rely on the past as a basis for justifying the present occupational, semi-professional or technical curriculum is extremely

dangerous, particularly if Orange County's junior college programs are to serve students effectively in the work-a-day world. A few illustrations from the national scene may suffice:

> The occupational group of professional, technical and kindred workers increased 47% from 1950 to 1960, in contrast to 15% in the total experienced labor force. Mathematicians increased 348%, aeronautical engineers 194%, psychologists 147%, industrial engineers 140%, designers 133%. Technicians increased 141% over the decade, with the largest increase among electrical and electronic technicians, 680%.
>
> 1964 World Almanac

> Farm employment was 17% of total US employment in 1935, but shrunk to 7% by 1962.

> The age group under 24 years of age accounts for 18.3% of the labor force but for 37.2% of unemployment.

> Today throughout the country only 6% of jobs are unskilled. At the other end of the scale 18% of positions are in professions which require four or more years of college.

> Automatic elevators have recently displaced 40,000 elevator operators in New York. New equipment in the Census Bureau enabled 50 statisticians to do the work in 1960 that had required 4,000 such people in 1950.

> Technology has created a new relationship between man, his education, and his work, in which education is placed squarely between man and his work. This relationship may now be said to exist for all men and all work.
>
> Grant Venn in Man, Education and Work

The general trend of this changing occupational scene may be judged from the table which follows, taken from Page 8 of the Venn study:

MAJOR OCCUPATIONAL GROUPS AS A PERCENTAGE OF TOTAL LABOR FORCE

	1900	1947	1960	1975
White-Collar Workers	17.6	34.9	43.1	47.8
Professional & Technical	4.3	6.6	11.2	14.2
Managers and Proprietors	5.8	10.0	10.6	10.7
Clerical Workers	3.0	12.4	14.7	16.2
Sales Personnel	4.5	5.9	6.6	6.7

	1900	1947	1960	1975
Blue-Collar Workers	35.8	46.7	36.3	33.4
Craftsmen & Foremen	10.5	13.4	12.8	12.8
Semi-Skilled Operators	12.8	21.2	18.0	16.3
Laborers (excl. of farms & mines)	12.5	6.1	5.5	4.3
Service Workers	9.0	10.4	12.5	14.3
Farm Workers	37.6	14.0	8.1	4.5

These national-scene figures, however, are of little assistance to us in determining junior college curricula in Orange County. They tend to hide in their general categories the specifics upon which occupational education must be based if it is to be effective. Also, probably the occupational structure of Orange County is very different from that of the nation, and, with its sophisticated technology, in a more rapid state of flux. Moreover, even when specific data on occupational trends are secured, such statistics do not disclose which are the "vestibule jobs" or entry jobs for the new trainee starting to work in the labor market, as the junior college graduate will be. Nor do they disclose the "advancement pattern" by which a person, after entering his "vestibule" position, advances in the occupation. Clearly education for the labor market must take these factors into consideration and recognize, too, the possible changes required of labor which technology may bring about. The data that follow clearly indicate that preparation should be broad, with sufficient background in related study and experience to give maximum adaptability for promotion and change in technology. Although our major concern here is for the student who is preparing for his first career position, we cannot overlook the need for the reeducation of those whose previous skills or technologies have become outmoded or need to be updated. By meeting these needs the junior colleges will also be of service to the people as well as to the economy of the region. Such matters as these have encouraged the survey of evidence existing in Orange County that might guide the structure and form the educational facilities.

This study makes no pretext of finality. Its limited time and resources confine it to analysis of evidences rather readily available and with emphasis on economic aspects. Although we believe its findings will be of considerable

assistance to the junior colleges, in a sense the study is exploratory of problems, evidences and needs which a much larger and longer-range study should subsequently undertake.

Several types of evidence are included in this study. Chapter I discusses and analyzes the trends within the junior colleges by using evidence of actual enrollments in specific occupational fields over the past five years, together with supply and demand figures for occupation from the junior college placement records for the past year. Chapter II is devoted to career placement of junior college students majoring in occupational curricula and contains a review of the job market as it concerns the terminal student of these two colleges. It represents a very modest supply and demand study of the occupationally prepared junior college student. Chapter III is concerned with the economic setting for changing educational programs in Orange County and presents an over-all view of the most obvious economic forces that are shaping the population and industry characteristics of the county. The chapter contains many charts and graphs to illustrate the dynamic economic developments of the county. In Chapter IV the impact that technology might have on the directions of industry employment is analyzed. Chapter V presents information on some specific occupations drawn from a sample of business and industrial firms and from the study generally, and, finally, Chapter VI contains observations drawn from the study as a whole and the experiences of the directors.

The co-directors have drawn upon the services and view of several individuals in the development of the several specialized phases of the study. These have been: Dr. Paul Sultan*, Chairman Economics Department, Claremont Graduate School, and specialist on labor economics; Dr. Gerhard Rostvold, Professor of Economics, Pomona College, specialist on regional economic trends, population, and valued member of the staff for the 1960 junior college study of Orange County; Mr. Robert Gates, Administrative Assistant--Business, North Orange County Junior College District, who has directed and compiled studies to gain specific employment information from selected employers of the County and the study of placement of junior college students. The superintendents of the two sponsoring

*Through the efforts of Dr. Sultan, this study had the services of Western Data Processing Center at the University of California at Los Angeles.

junior college districts, Drs. Lake and Watson, have been most helpful in presenting ideas and making personnel available for much of the detailed work. We particularly appreciate the help of Placement Officers and those who have interviewed employers and the assistance of Mr. Frank O. Hopkins and Mr. Chester Gromacki who have coordinated activities in each district. Mr. Norman R. Stanger, Director of Vocational Education in the office of the County Superintendent of Schools, did much effective ground work in getting the project under way. The co-directors are appreciative of Miss Eva Jensen and Mr. Jack E. Lyons of the California State College at Fullerton Foundation who have cared for business aspects of this project and of Mrs. Jean Knox and Mrs. Ruby C. Jordan for typing and helping to prepare the preliminary and final copies of the report.

CHAPTER I

ENROLLMENT TRENDS IN OCCUPATIONAL CURRICULA IN ORANGE COUNTY JUNIOR COLLEGES* 1960-61 to 1964-65

In this chapter we are concerned with what has been happening in junior college enrollment of students in vocational, technical and semi-professional curricula over the past five years. It is desirable to ascertain in a study of this kind where we have been in terms of this enrollment and where we are now as one basis for determining where we might go. Two tables present the overall picture. Table 1 gives the total enrollment trends of the two junior colleges in terminal occupational areas for the past five-year period. Table 2 presents the enrollment trends by specific occupational majors within these areas and the size of the enrollment. Both Tables 1 and 2 are based on Table A found in Appendix A. This latter table gives figures in detail not only for the six major areas but for the sub-groupings within the areas.

Data from the junior colleges participating in this study were obtained by using a form adapted from Directory of Occupation Centered Curriculums in California Junior Colleges and Schools for Adults published by the California State Department of Education, 1964 edition. Since all junior colleges report on this form, it was felt that reasonable accuracy would be assured and comparisons might be made with other junior colleges in the second phase of this study to be conducted later on if this form were used. Minor deviations in reporting enrollments on the form by the junior colleges were incorporated under existing classifications, except Metal Trades and Metallurgy, which were reported separately in Occupational Area No. 2, Homemaking, which was reported separately in Occupational Area No. 4, and Art and Interior Decorating, which were reported separately in Occupational Area No. 5.

The phrase "major occupational curricula" is interpreted to mean those one

---

*The junior colleges cooperating in this phase of the study are: Fullerton Junior College, Fullerton, California, and Orange Coast Junior College, Costa Mesa, California.

to two year program of study preparing directly for employment and taken by terminal students. These one to two year terminal curricula are in contrast with the transfer curricula which lead to professional preparation necessitating the transfer to state colleges, universities, or other institutions of higher learning offering four or more years of preparation.

Reference to Table 1 shows that there has been more than a doubling of enrollment in Occupational Area No. 1 - Business and Management, Occupational Area No. 3 - Health Services, and in Occupational Area No. 4 - Other Services (includes Fire Science, Police Science, Library Assisting, etc.). Occupational Area No. 5 more than tripled in enrollment, but the number of students involved is not as large as is true for Occupational Areas No. 1 and No. 2. Occupational Area No. 2 - Trade and Technical, and Occupational Area No. 6 - Agriculture, Horticulture and Forestry, increased at about the same rate, but the number of students enrolled in Occupational Area No. 6 is relatively small.

Enrollment trends in specific junior college occupational curricula are given in Table 2. The enrollment figures given on the left are those of 1964-65.

Increased enrollment over the five year period was shown in twenty-six majors in the six occupational areas as shown by Table 2. A static condition or no appreciable change in enrollment was found in twelve of the major occupational curricula. In this part of the analysis some judgments had to be made, for there were a few instances in which a small increase in enrollment was followed by a small decrease in enrollment and vice versa. Seven of the specific occupational curricula in this column were checked with a question mark. However, the over-all picture in these instances appeared to be one of no change. Five of the vocational-technical majors showed a decrease over the five-year period.

SUMMARY AND CONCLUSIONS

This brief chapter has indicated the current status and growth trends during the past five years for the occupational preparation programs in the two junior colleges of this study. From the evidences of these data only, it would appear that all of the occupational areas, with the possible exception of Occupational Area No. 2 - Trade & Technology, and Occupational Area No. 6 - Agriculture, Horticulture and Forestry, were growing at a pace which may be in balance with the observed expansion of the employment demands in the regional economy.

If enrollment trends of the past were the only consideration in determining occupational curricula for present and new junior college campuses, it would seem safe to include studies in preparation on all campuses for all occupations which have substantial and increasing enrollment as indicated in Table 2. However, a number of added occupations will be noted which appear to have enrolled fewer students than may be needed by the economy and/or which may have been static or decreasing in numbers over the past five years. Sales and Retail Merchandising may be a case in point.

Occupational curricula in which no enrollment was reported by either junior college included in the study were: Industrial Management; Traffic and Transportation; Advertising; Retail Floristry; Telephone Operation; and Airline Stewardess and Steward in Occupational Area No. 1. Laboratory Assisting; Communications; Instrumentation; Electro-mechanical Technology; Tool Designing and Tool and Die Making; Aeronautics; Air-Conditioning; Heating, Refrigeration and Stationary Engineering; Industrial Pattern Making; Plumbing and Pipefitting; Mining; Petroleum Refining; Baking; Apparel Construction; Dry Cleaning; Shoe Repairing; Furniture Upholstering; Household Appliances Repair; Business Machine Service; Watch Repair; and Gunsmithing in Occupational Area No. 2. Dietetics; Dental Technology; Dental Hygienist; Ophthalmic Optics; and Sanitation Technology in Occupational Area No. 3. Fire Science; Nursery School; Recreational Leadership; Vocational Housekeeping; and Swimming Pool Service in Occupational Area No. 4. Technical Art and Commercial Art; Journalism; Theatre Arts; and Women's Clothing Designing in Occupational Area No. 5. Agricultural Management; Agriculture Mechanics; Poultry Husbandry;

Animal Husbandry; Dairying; Dairy Products Manufacturing; Pomology; Viticulture and Enology; Vegetable and Field Crops; Floriculture and Ornamental Horticulture; and Forestry in Occupational Area No. 6.

It becomes apparent that many other evidences are needed if decisions about inclusion of occupational curricula or their modification are to be made objectively. The remainder of this study is devoted to some of these evidences.

CHAPTER II

CAREER PLACEMENT OF JUNIOR COLLEGE STUDENTS MAJORING IN OCCUPATIONAL CURRICULA

Although this study will place its greatest emphasis on economic analysis and projections as they relate to the vocational, technical, and semi-professional curricular planning of the two junior colleges under consideration, these will be better understood if the actual curricular situation of the moment, together with recent trends in these respects, is understood. Thus, Chapter I has been devoted to a brief study of occupational enrollments in these two junior colleges and trends during the past five years. This chapter, similarly, will be devoted to a brief review of the job market as it concerns the terminal students of these two colleges. In a sense, this will represent a crude supply and demand study as it concerns the occupationally prepared junior college student.

With the assistance of the Placement Directors of each college, working with key department chairmen and faculty members, estimates have been obtained of: a) the number of job orders received from business and industry, b) the number of students placed in these jobs, and c) an estimate as to whether the demand trend was increasing, stable or decreasing. The year 1964-65 was used for this study. Part-time jobs were not considered in our final analysis, though hundreds of these were reported, and no doubt many of these were entrance jobs to careers.

Table 3 presents these data in consolidated form for the same six major occupational areas as in Chapter 1. It will be noted that in excess of 2,000 full-time job orders were placed by business and industry with these two colleges during the year 1964-65 and that for each area the demand appears to far exceed the supply as measured by placements actually made. The largest number of orders was Occupational Area No. 2 - Trade and Technical fields, where also the largest proportion of orders was filled by placement of junior college students. This area was followed by Occupational Area No. 3 - Health Services, in second place, and Occupational Area No. 1 - Business & Management, in third place, except that the latter had a lower proportion of job orders filled by junior college

TABLE 3

TOTAL JOB ORDERS RECEIVED AND TOTAL JOB PLACEMENTS MADE FOR THE TWO JUNIOR COLLEGES OF THIS STUDY FOR THE YEAR 1964-65, BY MAJOR OCCUPATIONAL AREAS, FOR FULL-TIME CAREER JOBS ONLY

Occupational Area	Total Job Orders	Total Job Placements	% Jobs Filled

Total	2097	799	

students than the Occupational Area No. 5 - Applied and Graphic Arts. The number of job orders in Area No. 6 - Agriculture, Horticulture and Forestry, was minute. It would appear that the substantial demand for employees in Occupational Area No. 4 - Other Services, with the low proportion of positions filled, would justify greater emphasis on the occupations of this area.

For detailed information about specific occupations, one should consult Table 4. It will be noted that this has a column indicating job trend in demand. Occupations within areas 1 and 3 seem to be increasing in demand to a greater extent than in other areas. A careful review of each of these occupations will indicate many which may be significant for this study, either because they show heavy volume of demand or because of the marked discrepancy between demand

and supply. In general, it would appear that there should be occupational curricula in one or more junior colleges of the County in most occupations listed in Table 4 with job orders of 20 or more. Unless there is a drastic change in employment conditions, there are likely to be good employment possibilities in each of these areas. Special cases should also be made for curricular inclusion of many fields in which job orders were fewer. It is apparent that the evidences of this chapter must be combined with other evidences, to be treated later, to be of maximum value.

SUMMARY AND CONCLUSIONS

To be more specific, it appears that in many instances job orders far outrun enrollments in certain vocational curricula and this should be thoroughly checked in the second phase of this study. From the data available thus far in this study, expansion of or the addition of curricula in contemplated colleges seems warranted in Secretarial and Stenographic, General Clerical, Data Processing, Sales and Retail Merchandising, Hotel and Restaurant Management, Accounting and Bookkeeping, Drafting, Surveying Technology, Registered Professional Nursing, Licensed Vocational Nursing, Nurses Aids, Dental Assisting, and Police Science, to mention but a few.

Placement trends and job orders seem to conform generally to the four major economic groups in Orange County employing 80% of the workers, namely, manufacturing, wholesale and retail trade, services, and government.

CHAPTER III

THE ECONOMIC SETTING FOR CHANGING EDUCATIONAL PROGRAMS IN ORANGE COUNTY

In this chapter, we shall present a global view of the most obvious economic forces that are shaping the population and industry characteristics of Orange County. In Chapter IV, the impact that technology might have on the directions of industry employment will be analyzed. This, in turn, will lead us to the vital information on the region's occupational structure and needs in Chapter V.

Population Growth: 1940-1975

Orange County's population continues to grow at a spectacular rate. In the five-year period from April 1960 to April 1965, its population increased by 432,400 persons. During the entire decade of the 1950's, population increased by a total of 487,701 persons.

Recent population data developed by the Orange County Population Research Committee indicate that the population of the County grew by 26,014 persons during the first quarter of 1965. This would suggest that population currently is growing at an annual rate in excess of 100,000. These data suggest an increasing rate of household formation and school enrollments in the decade ahead.

Population growth data from 1940 through 1975 are summarized in Table 5.

For general planning purposes it is interesting to note in Table 6 the geographic pattern of recent population growth in Orange County. Huntington Beach, Orange, and Anaheim have grown most rapidly in the past year.

The population growth of the County during the past decade has not proceeded at an even pace. Annual increments range from 47,816 between 1957-58 to 104,804 between 1962-63. It would appear that the 1965-66 growth will match or slightly exceed that of 1962-63.

1965-66*	105,000

*Rostvold Projection

The uneven pattern of growth can be seen graphically in Figure 1.

There has been an increase in the labor force participation rate of the population in Orange County. For example, the California State Department of Labor estimates that in 1958, 28.6 percent of the Orange County population was in the labor force and that by 1964 this had increased to nearly 32.0 percent of the Orange County population. This growing percentage reflects the general youthfulness of the working population, suggesting a measure of the growing responsibilities of the Junior College Program revision during the next decade. Clearly, a growing population produces a direct increase in effective demand for labor services in the so-called non-basic areas of employment such as wholesale and retail trade, services, construction, finance, transportation, communications, utilities, and government. The Junior College curriculum should be geared to meet the expanding employment which will inevitably occur in the non-basic areas. These are the areas of employment related to population growth and the attendant formation of new household units.

Long-Term Trends of Industry Employment:

The long-term trends in the reallocation of employment activity are suggested by Bureau of Census data derived from the Census Years 1940, 1950, and 1960, as seen in Table 8.

FIGURE I

ORANGE COUNTY - ANNUAL POPULATION INCREASE: 1955-56 TO 1964-65

The dramatic industrialization of the county is seen in the fact that farm employment, 21.3 percent of the total county employment in 1940, decreased to a modest 3.3 percent of total county employment in 1960. The reverse pattern is seen in manufacturing employment: it represented only 10.3 percent of the total county employment in 1940, but increased to 28 percent by 1960. Government employment increased from 3.6 percent in 1940 to 8.8 percent in 1960, while more moderate advances of the employment proportions were realized in wholesale and retail trade (increasing from 15.9 percent in 1940 to 18.5 percent in 1960) and contract construction (increasing from 6.4 percent of total employment in 1940 to 8 percent in 1960). Service employment diminished in its relative employment role, as did mineral extraction activities.

Short-run Industry Employment Trends:

To what extent are the broad relocations of employment from 1940 to 1960 supported by more recent evidence of employment shifts since the beginning of this decade?

Total employment in Orange County rose from just over 150,000 (the annual average) in 1958 to 325,400 by September, 1964. This represents a net gain of about 112 percent in just six years, which compares favorably with the 84 percent increase in population for the same period. The comparatively greater rate of job growth indicates that the proportion of workers both residing and working within the County is greater now than was the case in 1958. Non-farm jobs, other than factory, have nearly doubled, rising from 112,000 to 223,000, while factory work forces were up to 93,400 in September of 1964 for a 172 percent increase since 1958. By 1963 over 3 of every 10 employees were engaged in manufacturing activities, compared to 22.4 percent six years earlier. The average number of workers employed on farms has remained fairly steady throughout the years at the 7,000 level.

The sustained upward trend in the level of County employment is indicated in Figure 2. This index reveals bi-monthly employment in the county from January, 1958 to June, 1965. With a straight-line, the trend of total employment plotted against time indicates that the 'average' employment increase for this time span has been 2,345 per month. The correlation of the total employment value against time offers a regression value of .9941, suggesting that the prediction of a sustained upward trend of employment can be made with convincing certainty.

1965

Over 142,000 jobs were added to the employment base of Orange County from 1960 to mid-year 1965. The major industrial groups in which the employment increases occurred were the following:

Manufacturing	+46,700
Wholesale and Retail Trade	+27,200
Services	+24,800
Government	+19,100

We see that manufacturing, trade, services, and government sectors accounted for 117,800 jobs; this increment represented 83.0 percent of all of the additions to Orange County's employment base between April, 1960, and June, 1965.

The five-year shifts in the proportion of labor allocations are indicated in Table 9. The shorter time span does not, of course, reveal as sharp a change in labor use as those indicated in 10-year Census data. Significantly, however, agriculture continues its decline, while manufacturing continues to increase in relative importance.

TABLE 9

TOTAL EMPLOYMENT IN ORANGE COUNTY

Source: California State Department of Employment

The significance of manufacturing to the Orange County economy deserves, of course, more specific attention. In Figure 3, the bi-monthly data on manufacturing employment from January 1958 to June 1965 is again plotted. Note that sharp upward speed in manufacturing employment was broken in the fourth quarter of 1962. The growth rate in this major sector is still positive, but the rate of growth has moderated since the fourth quarter of 1962. Taking the entire time span, the straight-line fit of manufacturing employment trend indicates a monthly increase of 771 persons per month.

Because manufacturing activity is of ascending significance in Orange County, it is important to appreciate the heterogeneous mix of activities represented by that category and the notable role of electrical machinery manufacture to the manufacturing sector. As we see in Table 10, durable manufacturing accounted for close to 79 percent of such employment, with 21 percent represented by nondurable activities. But for all manufacturing employment 44 percent was accounted for in electrical machinery activity. Because no other single manufacturing employment (with aircraft and missiles at 8.08 percent, the second largest component), the vitality of manufacturing activity clearly reflects the buoyancy of electrical manufacturing employment.

Industrial Employment Refinements:

A further refinement of employment trends by industry in the Anaheim-Santa Ana-Garden Grove labor market areas follows:

Straight-line trends were calculated for nineteen major employment sectors from monthly data running from January, 1958, to August, 1965, with the results indicated in Table 11. If employment is regressed against time, the slope of that line indicates the increment of employment for each month. In Table 11 the monthly increments are arrayed in terms of their size, again indicating the significance of four major sectors: electrical machinery, services, retail trade, and government. The increments of employment for a year, two years and five years are readily derived by multiplying the increment by the time interval. It should be realized, of course, that the projected employment increases are not the gross number of jobs likely to be created in the future. To these one must add the job vacancies created by the natural attrition and turnover of employees.

Other Durables	6,400	6.63
Total Durables	76,100	78.85
Non-durables:	(20,400)	(21.15)
Food	6,500	6.74
Paper, Printing, Publishing	6,600	6.84
Chemicals	1,700	1.76
Rubber and Plastics	3,700	3.83
Other Non-durables	1,900	1.98
Total Manufacturing Employment . . .	96,500	100.00

There is considerable risk in making straight-line projections of employment in an area subject to such diverse economic pressures and rapid - but sometimes uneven - industrial growth rates. The reliability of the projections can be assessed by reviewing the values for the correlation of employment to time, as seen in Table 12.

The patterns can be seen more clearly, however, when plots are made of the industry employment level, as provided in Figures 4 through 7. These indices have been grouped to draw attention to varying characteristics of the employment pattern.

TABLE 11

PROJECTED INCREASES OF TOTAL EMPLOYMENT IN ORANGE COUNTY BY INDUSTRY
Projections based on regressions of industry employment on time, making use of monthly data of industry employment from January, 1958, to June, 1965

The Seasonal Sectors:

Four sectors - wholesale trade, food, rubber and miscellaneous plastics, and agriculture - have been grouped in Figures 4 through 7 (following Table 12) to indicate the highly seasonal nature of employment. Most dramatic, of course, is agriculture where there is little evidence that the wide swings of employment are being dampened through time. More significant is the pronounced seasonal variability of employment in the growth sectors of wholesale trade and food

processing. Surveys made of current manpower needs in these sectors must give attention to the seasonal rhythm of manpower requirements within the year.

The Sustained Growth Sectors:

This group, represented by Figures 8 through 11, is made up of sectors which, while subject to seasonal influences, appear to be relatively immune to cyclical influences. This group, in effect, enjoys a sustained trend of employment expansion. It includes (in order of size of employment expansion) services; retail trade, transportation, communication and utilities; and paper, printing and publication. The first three account for monthly employment increases of 1100 persons, and are major sources for stabilizing the pace of increase of job opportunities in Orange County.

The Erratic Employment Group:

While total employment, as we noted earlier in Figure 2, has enjoyed a rather sustained growth in the period under analysis, there has been sharp variability in both the numbers unemployed and in the proportion of the unemployed to the labor force. A 'hump' in the unemployment percentages can be seen in Figure 12 for 1960 to 1962. While the total of unemployment has been climbing since its low in the end of 1962, (see Figure 13) the number of job opportunities has also been expanding so that the percentages of unemployed have been hovering around the 5 percent level since 1962. The seasonal variability in the unemployment rate should also be noted. Again surveys of manpower requirements made by the Junior Colleges might be biased should questions (involving entry-level requirements and so on) be asked when labor appears to be in abundant supply.

In the 'erratic employment' group we place both fabricated metals and non-electrical machinery, (Figures 14 and 15). The upward but erratic pace of employment growth, with such variability, is not fully explained by seasonal factors alone.

The Employment Stabilizing Sectors:

We have noted the dramatic upward shift to manufacturing employment in Orange County since 1940. But we noted, too, in Figure 3 that there has been some leveling of the employment growth rate in manufacturing since 1962. Several components in the manufacturing sector help explain this leveling characteristic. Most significant, electrical machinery, in Figure 16, 'peaked' by the end of 1962,

and employment here has since that time been drifting downward. The downward tendency in construction (Figure 17) is also in evidence since its peak in mid-1964. Other sectors displaying this 'hump' characteristic include scientific instruments; and lumber, furniture and fixtures, and chemicals (seen in Figures 18, 19, and 20). It is likely that sharp declines of employment in the electrical machinery sector have induced secondary employment consequences in these related activities.

The"Take Off" Sectors:

Another grouping, seen in Figures 21 to 25, include those sectors where the upward swing of employment appears to be increasing at an increasing rate, dominated by the sharp increase of aircraft and missile employment beginning in 1962. Upward sweeps are also in evidence in stone, clay and glass and in the general category of 'other durables.'

The picture of broad trends of industry employment do not reveal, of course, the complexity of forces working within the components of the manufacturing sector to account for shifts in manpower use. In order to give a 'sampling' of some of these forces, the following extractions are drawn from the Orange County Labor Market Bulletin (printed monthly since October 1964):

> October 1964:
> Two major employing groups - public schools and factories - scored large job gains over the past thirty-day period but these increases were largely offset by seasonal declines in the farm, trade, and service industries.
>
> A labor dispute in the food distribution group also tended to restrict the net employment increase.
>
> The service groups, up by 6,400 in the past twelve months, led all others in job growth, but were closely followed by trade and government, with gains of 5,400 and 4,300 respectively. Manufacturing payrolls were up 2,900 over the year despite a 2,700 loss in electrical machinery during the same period. The transfer of a large electronics production unit from Los Angeles County and some step-up in defense contracts helped boost electrical machinery employment from 41,900 to 42,600 during the past month.
>
> Aircraft and missile makers added 300 workers in October to bring the current job level to 6,600 or up by 2,100 over the year. Aerospace production has become the County's second largest source of durable goods jobs despite the loss of a major plant that closed in late 1963.
>
> Summer recreational workers were released by local government agencies but total public service employment was up by 1,700 from September as

schools began to approach their full staffing complement for the 1964-65 school year.

Farm labor needs diminished by 1,000.

January 1965:
More than two thirds of the job losses of the past thirty days were induced by the release of temporary holiday workers in trade and government while seasonal reductions in farm and tourist traffic related activities resulted in a decrease of 600 workers.

A reduction of 500 temporary mail carriers and clerks lowered government payrolls to 42,300 in January.

Declining winter tourist traffic reduced workers needs by 300 in service industries such as hotels and recreational facilities.

The pressure by local packing houses to build up their lemon inventories in December prior to termination of foreign worker program and dry weather which delayed fruit growth were held responsible for this year's lowered labor needs.

The job level in mining, which tends to be quite stable, rose by 100 from December due to an increase in petroleum exploration and production.

October 1965:
The area's comparatively new missile industry employment reached 9,600 in October or up 400 from September and 3,000 over the year. Future growth in this industry is expected to boost payrolls by a hefty 50 percent within the short span of six months.

A major firm recently announced a $10.5 million expansion program that will include six new buildings and transfer of a major division headquarters to Orange County. Most of the recent and anticipated worker increases involve relocation of personnel from other plant sites, most of which are in Los Angeles.

Factories producing fabricated metals, nonelectrical machinery, scientific and musical instruments also contributed to a higher worker count. The electronics component industry was the one weak spot as employment declined by 300 in a mixed pattern of large layoffs and moderate hiring programs.

November 1965:
Additional workers were required by outlets selling general merchandise, groceries, apparel and drug items, but restaurants and auto dealers reported small losses.

Service industry job opportunities turned out to be better than expected with the usual increase in recreational and medical services augmented by a healthy advance for aerospace-oriented research and development activities.

Electrical machinery dropped by 300 to 41,600.

Increased activity in garment factories in addition to the opening of a new bakery cut November losses for the soft goods group to 300.

Monthly studies of major labor market adjustments for Orange County would quite logically emphasize the seasonal shifts within the year, but the sampling of commentary suggests the range of forces at work within the labor market area that modify the contours of job opportunity from day to day. Junior College personnel concerned both with student advisement and curriculum design could probably acquire an appropriate 'sense' of county employment trends by reviewing these monthly studies made available by the Department of Employment without cost. A more refined procedure would involve their analysis by a County School planning committee, with the subsequent distribution to school personnel of their more obvious implications for the vocational programs of the schools and counseling activities.

The Number and Size of Firms in Orange County Manufacturing Employment:

In its Annual Industrial Inventory of 1965, the Orange County Planning Department noted that there was a total of 28,041 acres of industrially zoned land within the county, with proposals for the zoning for industrial use of an additional 7,069 acres. The percentage of developed industrial land to the zoned base is only 27.8 percent, indicating the immediate land expansion potential. Another dimension to the structure of county activity is access to transportation. Currently there are 85.9 miles of freeways constructed within the county, with the California State Division of Highways planning an additional 246 miles. The significance of this growth can be appreciated when it is realized that, prior to 1950, Orange County had no freeways. Additional transportation facilities are available to the county through three major railroad lines, two heliport terminals and three airports.

The number of manufacturing firms in the county as of July, 1964, was 1,356, with total manufacturing employment at that same date placed at 92,181. Significantly, the number of new manufacturing firms locating in Orange County from 1960 to 1964 was 424, and the addition of firms undoubtedly contributed substantially to the increase of manufacturing employment (of over 46,000) in that same interval. In the view of the County Planning Department, the expansion of new firms is clear evidence that "this region offers an industrial atmosphere

conducive to a wide span of operations."

The County's manufacturing base represents all of the Standard Industrial classifications except tobacco processing. A measure of employment concentration that makes use of the Standard Industrial Classification groupings indicates that there has been some tendency towards employment concentration. A perfectly diversified economy would be rated at 850, with complete employment concentration rates at 1600. For Orange County in 1960, the diversification index was 1,221, whereas four years later in 1964 the index number had increased to 1302. The County Planning Board concludes, however:

> While Orange County has become slightly less diversified in recent years, it has tended to concentrate in those industries offering high per capita incomes, specifically electronics, aerospace and the areas of research and development. Inasmuch as high income employment tends to support a wide range of economic activity, the trend towards less diversification is not necessarily critical. (p 13)

The size of industrial operations has obvious significance for the planning of junior college vocational programs, for it is likely that the smaller employer will be more dependent on the skill acquisitions of potential employees acquired in school or through previous experience. He has less opportunity or resources to institutionalize in-plant training programs and is more inclined, therefore, to seek employees with 'ready-made' skills. There is likely to be less formal or specific definition of job skills required for the smaller plant, and it is likely, too, that job duties will span over a broader range of functions. Further, the size of the firm has also considerable influence of labor turnover experience, although the statistical influence in this regard has yet to be formally established.

The following Table 13 arrays (in terms of size of employment as of July 1964), the number of employees with the number of firms for major manufacturing categories.

Table 13 indicates the 'average' index of employment concentration for several of the manufacturing components (refined beyond the 'two digit' classification represented in the earlier analysis of this chapter). There is some positive association between total numbers employed and the size of the firms in Orange County, a factor that can encourage generalizations about occupational needs when samples of opinion are secured from representatives of firms of large size cooperating with an occupational survey. But it should be remembered that

TABLE 13

while large firms are more likely to have formalized definitions of job requirements, there may well exist a considerable 'entry-level' market for the vocationally-trained junior college graduate in the smaller firms, for the reasons indicated above.

Geographic Distribution of Industry Employment Within the County:

The data provided to this point make clear the heavy dependence of the County on electronics and defense related activities. The rational design of the college curriculum requires more than information about industrial areas of expanding job opportunities. Information must be secured, too, regarding the geographic distribution of industrial activity within the County. While commuting patterns suggest considerable mobility for labor in the Southern California area, it would make much sense for the junior colleges to effect a 'division of labor' in the allocation of vocationally-oriented programs to reflect the specialized economic activities that characterize the geographic area of the college.

In Table 14, information is provided regarding the ten major employers of labor (by employment size) in Orange County, with the attachments of the number of firms to selected areas within the County.

The distribution of firms by city area within the County, even compared with the average size by firm provided in Table 13, can provide school planners with a first approximation of the location of economic activities that might be served by vocational specialities of new institutions (or by refinements in the division of activities of existing programs). It would be important, of course, to follow preliminary inferences drawn from employment averages with more specific information regarding the skill mix required by such industrial attachments, and, of course, to secure further detailed information on the distribution of the actual employment (lest essential details on job locations be obscured by these industry employment averages).

SUMMARY AND CONCLUSIONS

The statistics of this chapter indicate the following:

(1) Orange County enjoys an upward sweep of employment for most industrial sectors, a reality that can serve as a positive influence in pulling resources, including the junior college student, into programs of mutual benefit to industry and the individual. It is necessary, however, that data on industrial employment be made available to area institutions on a more regular basis and that inferences for their training and vocational programs be more systematically reviewed. In this respect, a regular digest of the Orange County Labor Market Bulletin would prove useful for vocational counselors and those concerned with curriculum design.

(2) The dependence of Orange County on missile and defense-related activity indicates that the County must cultivate sophistication in its incoming labor force if it is to sustain (or expand) the economic benefits to the community that such activity allows. Defense and research activity is undoubtedly drawn to known reserves of intellectual talent rather than to excesses of technical capacity or other influences that might be more important to the private sector.

(3) The buoyance in employment observed in the recent decade can, in part, be attributed to the expansion of missile and related employment activity. The variability of federal expenditures in this area compounds the economic uncertainties for the regional economy and makes all the more obvious the need for junior colleges to provide students with a broad-based core of skills and understandings to maximize adjustment prospects that are obviously indicated.

(4) The electronics character of the economy further is on the cutting edge of technical change. It is all the more important, therefore, that training programs be 'geared up' for the technology planned for tomorrow, rather than to make use of 'conventional' production skills. Indeed, aerospace officials have, on occasion, found that the commitment of the worker to 'conventional' methods can sometimes handicap his adjustment to new technology. Again, emphasis on 'fundamentals' would be indicated, rather than on sustained attention to single production activities.

(5) It is likely that the mobility pattern for the individual worker will become increasingly varied in the future, with job enlargement the order of the

day. This indicates that the traditional family of skills is corroding, and that citizen advisory committees organized to serve the interests of single crafts or skills may have too narrow a viewpoint to identify the broad range of educational needs necessary to serve the student during his lifetime of activities. If this be true, it is suggested that the Advisory Committee structure be reviewed to give attention to the possibility of varying the size, number of selections of sophisticated, and reliable talent on the committee to give attention to (i) the significance of the industry to employment in the county; (ii) the significance of technological change in the industry; and (iii) the significance of the industry for 'entry level' jobs for junior college graduates.

It might prove helpful to organize the advisory committee on industry rather than trade lines. We assume there is much more prospect for inter-occupational mobility within the industry than inter-industry job mobility. As a consequence, it is important to identify the progression of jobs (and their requisite skills) that are traditionally associated with entry-level functions. Committees organized on 'trade lines' may become excessively specialized or narrow in their focus on craft traditions.

It might also prove helpful to increase the uniformity of committees' deliberations so that common information having vocational implications can be collated from all committee reports. This would be particularly important if the industry (rather than occupational) format were emphasized. A central agency should be responsible for collating vocational information throughout the County for further feedback and its possible translaction into educational policy. In fact, because the County is committed to plan its occupational curricula regionally, there is strong argument for County-wide advisory committees.

(6) It is necessary for the County to secure current information, not only on the over-all attachment of labor to industry (for these must certainly be translated into their occupational dimensions to be of direct value to educators), but also on basic changes in the structure of industry. Major plans for plant expansion and major in-migration patterns of industry should be noted (along with the inventory of human talent these require), so that junior colleges can accommodate their educational programs to meet the rapidly changing needs of this rapidly changing regional economy.

CHAPTER IV

TECHNOLOGY AND MANPOWER NEEDS IN ORANGE COUNTY

The effort to identify the occupational skills required by both public and private sectors of the Orange County economy is complicated by the subtle influences of a variety of pressures that cannot be readily isolated and measured. First, definitions of manpower needs are likely to be highly subjective, particularly if the employer is encouraged to identify the 'ideal' employee for a hypothetical vacancy. There is likely to be a considerable range between the bundle of employee characteristics the employer regards as 'desirable' and the educational background regarded as 'minimal.' Such assessments are likely to shift, too, in the light of the tightness of the labor market: during periods when labor is in abundant supply and when employers have only weak incentives to expand the size of their workforce, the definition of entry-level skill may be escalated to take account of the opportunity to screen applicants more severely. And increasingly, as workers are identified as part of the 'overhead' rather than variable costs because of efforts (encouraged by the union or otherwise) to stabilize employment, employers are inclined to make more intensive use of their existing workforce than add to their workforce. The less pervasive the pressures for adding to the workforce, then, the more likely are employers to enhance specifications for entry-level positions.

Another subjective element in the assessment of manpower needs is the possibility that some employers are not aware of the range of terminal-degree programs provided by junior colleges. Such ignorance or confusion can, of course, prejudice the 'objective reality' of placement prospects; it is likely that a survey of occupational prospects that proceeds from the list of existing vocationally-oriented programs would lead to a set of responses different from a review where the range of programs is not known.

In addition, personnel policy can very easily distort efforts to match occupationally-oriented programs of the Junior Colleges in Orange County with defined job needs. For example, the point of ingress for the Junior College graduate into the plant will reflect company policies to 'promote from within.' Where such policies are traditional or where collective bargaining agreements

narrow the options of the employers in recruiting employees for job vacancies, specifications for the entry-level position may not give attention to the technical competence that might ultimately be required in the job progressions that individuals could anticipate. In defining labor needs, therefore, employer responses may be colored by the institutional reality that prevents consideration of all possible candidates for the job.

As a variant on this same theme, one employer may define the entry-level specifications in terms of the occupational career that could be reasonably anticipated by a new employee and is thus attentive to the personal traits and technical skills that give promise of his capacity for retraining in the future. Again, the employer's perspective on the permanence of his manpower needs and his impulse to view the new applicant in terms of conventional paths of job progression will influence his definition of worker traits he is seeking.

We observe, then, a range of 'external' influences that can influence the employer perception of his labor requirements. To the list of elements suggested above--the 'tightness' of the labor market, institutional policy regarding promotional sequence, and the long-run and short-run perspectives of the employer--must be added the influence of technical change. Of all the pressures changing the configurations of labor needs, technical change is usually held to be most significant. In the analysis of this chapter, attention will be given to both process innovation (that is to say, changes in production techniques involving changes in the engineering form) and product innovation, or changes in product design and the product mix having implications for the quantity of labor required.

Efforts to isolate the specific effects of technical change on employment and skill requirements are complicated because there is no standard classification system yet devised for measuring technology or innovations in engineering forms. As a first approximation to technical change, economists have been making use of the labor productivity index on the assumption that a radical change in the output/man-hour-input ratio is likely where substantial changes in production technique have been introduced. But even here we lack complete labor productivity data on both the national and regional basis. No formal studies of the manpower and training implications of technical change have been made in Orange County.

The bulk of the material in this chapter has drawn heavily on two Department of Labor sources. First, Technological Trends in 36 Major American Industries, identifies some of the engineering changes present in the industry and some of the more obvious implications these have for the levels of employment. Second, more specific analysis of their occupational implications is provided by Ewan Clague (until recently Commissioner of the Bureau of Labor Statistics in the Department of Labor) in his paper "Effects of Technological Change on Occupational Employment Patterns in the United States" (prepared for the Conference on the Manpower Implications of Automation of the Organization for Economic Co-operation and Development, Washington D.C., December 8, 1964). In the absence of regional information, yet to be gathered for Orange County, inferences for regional experience must be drawn from studies that are national in scope. General conclusions of employment prospects giving careful attention to available data on technical change are provided in Table 15 . It will be noted that contract construction, electronics manufacturing, and both retail and wholesale trade, banking, and insurance are considered employment growth sectors. These industrial activities make up, as we noted in Chapter III, a substantial proportion of total employment in Orange County.

Employment decreases are expected in aerospace, dairy and meat products, and petroleum refining. Aerospace employment is, of course, very much dependent on changes in levels of defense spending. Declines in food processing and petroleum refining are attributed to anticipated mechanization. Let us turn, then, to specific technological patters in particular industries that are significant in Orange County employment:

In Electronic manufacture, it is anticipated that the use of micro-electronic circuitry and further mechanization of production techniques will have pronounced effects on quality of labor demanded. Nationally, employment is expected to increase 39%, from 778,000 in 1961 to over one million by 1970.

Dramatic labor savings can be anticipated in the use of semi-automatic equipment for testing and selection of transistors in component fabrication. More machines will be employed in assembly operations. The use of mechanized wiring machines will be extended.

It is expected that there will be a sharp increase in the use of computers and numerical controls for machine tools. Demand for the industry output is

TABLE 15

HIGHLIGHTS OF TRENDS IN SELECTED INDUSTRIES

Industry	Employment: 1962 (Thousands)	Employment: Average annual percent change 1947-57	Employment: Average annual percent change 1957-62	1970 Outlook
A. Industries in which employment may expand by 1970				
Air transportation	180	6.1	3.9	Growth of jet freight and passenger services may result in moderate employment gain.
Aluminum	72	6.0	2.0	New uses are likely to result in output and employment gains.
Banking	656	4.5	3.8	Substantial employment gains are likely, but growth may be slowed by electronic data processing.
Cement	40	1.4	-1.7	Employment gains depend on volume of construction.
Contract construction	2,909	4.0	-0.1	Employment is expected to expand if economy maintains growth.
Concrete products.	164	n.a.	4.1[1]	Employment increase is likely to continue if construction activity rises.
Electronics manufacturing. . . .	778[2]	n.a.	8.4[3]	Employment may continue to increase, but at a slower rate than recently.
Gas utility and pipeline.	204	2.3	0.3	Despite automation, greater output and construction may result in slowly rising employment.
Insurance	759	4.6	2.4	Rising sales will result in slow employment growth despite computerization.
Printing and publishing	925	1.9	1.2	Output is expected to increase, but more efficient processes may slow employment growth.

TABLE 15 - continued

Industry	Employment 1962 (Thousands)	Average annual percent change 1947-57	Average annual percent change 1957-62	1970 Outlook
A. Industries in which employment may expand by 1970 - continued				
Synthetic materials	136	1.9	1.2	Anticipated substantial growth in output will bring some employment expansion.
Trade, retail	8,521	1.9	1.3	Increased efficiency may offset growth in consumer expenditures, and a rise in employment is expected.
Trade, wholesale	3,061	2.1	1.1	Expanded merchandise volume may be expected to offset increased efficiency in materials handling, resulting in continued increase in employment.
Trucking	880	3.2[4]	3.1[5]	Laborsaving innovations and interindustry competition are expected to slow down growth in employment.
B. Industries in which trend in employment by 1970 is uncertain				
Electric power.	247	1.9	-0.9	Despite output gains, greater efficiency may result in stable or declaining employment.
Federal Govemment.	2,340	1.6	1.1	Management economies and increased use of computers may stabilize employment.
Glass containers	60	1.4	2.0	Larger and faster equipment may increase productivity and retard employment growth.

TABLE 15 - continued

Industry	Employment 1962 (Thousands)	Employment Average annual percent change 1947-57	Employment Average annual percent change 1957-62	1970 Outlook
B. Industries in which trend in employment by 1970 is uncertain - continued				
Iron and steel	592	0.9	-3.8	Wide range of technological improvements is expected to hold down increases in employment despite an expected growth in output.
Motor vehicles and equipment. .	692	.0	-2.1	Improved materials handling and other laborsaving equipment are likely to offset growing demand for motor vehicles, with ultimate result on employment uncertain.
Pulp and paper.	225	1.4	-0.1	Laborsavings in materials handling and pulping may reduce rate of employment growth.
Tobacco, cigarettes	41	-0.1	1.4	Relative stability in employment may not continue because of possible consumer reaction to medical findings.
Industries in which employment may decline by 1970				
Aerospace	635	14.1	-6.6	Changes in defense and space programs point to lower employment levels.
Bakery products	294	0.8	-0.6	Because of slow growth of consumption and greater use of faster equipment, production worker employment is expected to decline.
Bituminous coal	140	-6.0	-9.5	Further mechanization of underground mining is expected to reduce labor requirements despite expected output growth.

TABLE 15 - continued

Industry	Employment 1962 (Thousands)	Employment Average annual percent change 1947-57	Employment Average annual percent change 1957-62	1970 Outlook
C. Industries in which employment may decline by 1970 - continued				
Crude oil and natural gas	299	3.3	-2.7	Improved methods may more than offset some increase in activity, resulting in a decline in employment.
Dairy products	275	1.5[6]	-1.6	Improved equipment and faster pasteurization indicate a continued decline in employment despite a slow growth in output.
Footwear	241	-0.5	-0.2	New techniques and materials may reduce labor requirements.
Foundries, iron and steel	193	-1.6	-3.2	Greater mechanization of materials handling is likely to result in some decline in unskilled workers.
Foundries, nonferrous	72	1.6	-1.7	Laborsaving equipment may slow down increase in employment
Lumber and wood products	589	-2.5	-2.2	Continued employment decline is expected alongside improvements in logging and sawmill equipment.
Malt liquors	66	-0.6	-3.1	Processing innovations are likely to continue productivity advance, and, with output increasing slowly, employment may decline.
Meat products	313	1.9	-1.3	As mechanization advances, employment will continue to decline despite slowly rising output.
Petroleum refining	123	0.5	-4.4	Decline in employment may continue with greater automation despite anticipated increases in output.

TABLE 15 - continued

Industry	Employment 1962 (Thousands)	Average annual percent change 1947-57	Average annual percent change 1957-62	1970 Outlook
C. Industries in which employment may decline by 1970 - continued				
Railroads	700	-3.1	-6.6	Advancing technology is expected to contribute to further decline in employment despite improved outlook for traffic.
Telephone communication . .	688	2.8	-2.2	Employment may continue to decline despite growing variety and volume of communication services.
Textile mill products	903	-2.7	-1.7	Modernization is expected to result in continued employment decline.
Tires and tubes	86	-1.8	-2.2	Modernization may offset output increase with reduced employment
Tobacco, cigars	22	-3.5	-7.6	Changes in consumer preference may offset employment decline.
Waterborne transportation . .	121	-2.0	-2.9	Automation of old and building of new vessels will determine employment.

expected to continue to expand in the latter part of the sixties, with value of shipped products expected to increase from the 1961 level of $10.8 billion to $20 billion in 1970. There is evidence that electronic computers may be the major growth item in the electronics segment. Research and development expenditures reached $2.5 billion in 1962, with activities directed to maser and laser technology, fuel conversion for electrical energy, bioelectronics, automated teaching, and advanced communications. The demand for engineers, scientists, and technicians is expected to be most evident in this industry. The average annual percentage change in total production (in constant dollar terms) was 9.5 percent from 1958 to 1961, with an annual average percentage increase of total employment in the same interval being 8.4 percent.

Miniaturized electronic assemblies, functioning as entire circuits, are expected to have significant manpower implications. Employers indicate the need for an increased supply of fabrication personnel relative to assembly workers and the need for better trained personnel. Engineers must have more familiarity with "basic principles in science." Microelectronics and chemical processing will become increasingly important, relative to manual assembly.

In Aerospace, the shifts in the direction of spending for military hardware has induced changes in production technique. Most important is the use of numerically-controlled tools and an increasing volume of research and development activity. Employment is much related to defense and space programs. The industry is less involved in the standardized mass production of units, but is now turning to the custom production of complex parts or to production of a variety of complex items produced in small quantities for the missile program. The use of numerical-control (N/C) technology has been particularly significant in the short production runs of intricate shapes.

In 1962 400 N/C machines were in use in the industry, with the number expected to increase to 1,600 by 1970. Additional operations, such as drafting, welding and inspection, are being adapted to N/C. Reductions of unit labor costs are placed at from 20 to 80 percent.

New metal forming methods are being devised, with new adhesive bonding products employed. Electron beams are being used for welding and cutting and chemical milling, and electrochemical machinery is being developed to shape metal parts. These new techniques will require new skills and retraining.

Employment of scientists and engineers increased at an annual rate of 11.5 percent from 1957 to 1962. Significantly, the employment of production workers has not paced the increased employment of technicians and engineers during the upswing of aerospace activity, and during the downswing the layoff of production workers has exceeded that of the technical group.

Our defense and space programs, including automic energy and research and development, have greatly affected the occupational distribution of employment in the United States. For example, the dramatic increase in the demand for scientists, engineers, and technicians is related to expanding government expenditures for research and development. The defense work force has an above-average proportion of professional, technical, clerical, and drafting workers, and below-average proportions of semiskilled operatives. This contrast can be seen in Table 16, with its comparison of broad occupational groups in manufacturing employment as a whole with those in defense-related employment in private industry.

In the defense industry, 15 percent of the work force consists of professional and technical workers, as against only 9 percent in manufacturing as a whole. Indeed, the proportions of the more highly skilled administrative, clerical and craft workers in defense industry are higher than in manufacturing. Conversely, only 37 percent of defense employment (3 workers out of 8) are operatives or laborers, while about half of manufacturing employment consists of these occupations.

Another illustration of the higher-scaled structure of defense-oriented manufacturing can be seen in Table 17 which compares the occupational distribution in plants manufacturing military and space electronic end-products with that in plants manufacturing consumer products, such as radios and television sets.

In electronics manufacturing, employment in military and space products consists of 60 percent nonproduction workers and only 40 percent production workers, whereas in the manufacture of consumer products in that same industry only 30 percent are nonproduction workers and 70 percent production workers. Engineers and other technical workers were three times as numerous in military and space work, while clerical and stenographic personnel were nearly twice as numerous. Even among the production workers there was a marked difference. Nearly one-

third of the production workers in military and space products plants were skilled, with the remaining two-thirds semi-skilled and unskilled. On the other hand, nine-tenths of the production workers in consumer products were semiskilled and unskilled (over 63 percent of the entire work force). The major factor in accounting for this contrast is that military and space products are on the frontiers of technology; it emphasizes custom production subject to continued invention and improvement. Consumer products are more likely to be mass-produced items with large volume.

The demand shifts in Contract Construction in Orange County may largely wash out any decline of employment related to improvement in production technique or use of labor-saving technology. As noted in Chapter III, demand increases in Orange County can be anticipated because of new family formation, the rapid suburbanization of the area, and industry construction activities. Improvements in construction equipment involve an increase in its size, capacity, power speed and durability. Improvements in component parts, such as transmissions, have increased labor productivity by as much as 25 percent in some activities. On-site construction techniques continue to be improved with a marked trend to the off-site manufacture of building components. Production line techniques indicate more intense mechanization. One nailing machine, for example, can drive up to 500,000 nails every 8 hours. Labor economics of

Source: U.S. Department of Labor, Bureau of Labor Statistics; based on information obtained through field visits to electronics establishments.

Note: For further information see BLS Bulletin No. 1363, "Employment Outlook and Changing Occupational Structure in Electronics Manufacturing," October 1963, p. 37.

25 percent have been realized by use of prestressed concrete beams in place of structural steel in some areas. The use of adhesives and plastic allows greater flexibilities in design and greater speed of construction. Where carpenters work with pre-assembled building components, such as stairways, windows, and

doorways, skill requirements have, in some instances, been reduced.

In wholesale and retail trade, improvements in materials handling and the use of automatic equipment in supermarkets as well as the increased use of vending machines and other self-serving techniques are likely. Further use of computers can be anticipated for inventory control and billing. Employment will be expanding in spite of these labor saving devices, but employment is expected to absorb more and more part-time workers, including women and youth.

Large wholesalers of food and staple products will be installing automatically controlled conveyors for sorting and moving goods into storage. Smaller wholesalers may be merging to gain the economies of such technology and automatic warehousing. More use of conveyors is expected in larger retail department stores, with the new methods of palletizing goods reducing unit labor requirements in food warehousing activities.

Further development of automatic wrapping machinery is expected, with additional use of powered devices to reduce 'back room' work. Additional central prepackaging of perishable foods is anticipated. Research is now underway to develop automatic check-out counters which would total and bag items mechanically.

In the Federal Government sphere, the computers and quick copy equipment are expected to have an influence on total employment. Microfilm, data transmission and communication systems, as well as materials handling equipment, are being improved to increase efficiency. Further closing down of obsolete defense facilities can be expected. Routine clerical tasks will be reduced. The Federal Government had 1,248 electronic computers in 1963, with 10,000 employees working with digital computer systems as administrators, analysts, programmers and operators. Thousands of clerical personnel are involved in key-punch operations and supporting electronic data processing (EDP) tasks. The budget bureau estimates that 2,100 computers will be in use by June 30, 1966, a gain of 68 percent in 3 years. Electronic computers are now being used for accounting, check disbursing, insurance payment, tax return processing, and inventory control. They are used by the Weather Bureau, Patent Office, Bureau of Standards and Department of Defense. Programs are

now underway for integrating processing systems within and between departments. They are also being used to develop air traffic control systems. And research is underway of optical character recognition (OCR) equipment that would automatically read and transcribe text into card, paper or magnetic tape for computer analysis. The post office is develping techniques for the mechanization of mail sorting and distribution activities. Eventually, keyboard letter sorters may be replaced by optical scanners. Parcel post and sacked mail sorting machines have already been installed in several post offices. Magnetically controlled conveyor systems for transporting and sorting mail trays are undergoing field tests. Employment has expanded in this sector at the annual rate of 1.1 percent from 1957 to 1962.

Another example of the effects of introduction of electronic computers on office employees can be seen from a study made by the Bureau of Labor Statistics of the tax return processing in a southern region of the United States. This study shows that large numbers of routine and repetitive clerical jobs, particularly those relating to posting, checking, and maintaining records, have been cut back substantially. Also reduced significantly were the number of operators of bookkeeping machines and other office equipment. However, it should be noted that at the same time large numbers of key-punch operators (also classified as clerical workers) are now needed to transcribe data from tax documents to punch cards for processing by computers. Another major effect is the reduction in the number of lower-level supervisory jobs resulting from the elimination of certain routine clerical functions. Some new occupations related to administering and operating the computer system--systems analyst, programmer, and console operator--were created.

The printing and publishing component (representing 6.8 percent of manufacturing employment in Orange County in June 1965) offers prospects for improved, faster printing equipment, and greater use of photocomposition, offset printing, and tape controlled linecasting equipment. Training needs are directed to photographic skills, with an anticipated increase of employment of lithographic workers. Linotype operators, stereotypers and bookbinders may suffer some reduction of employment. An increasing number of small and medium sized newspapers have shifted from letter press to web offset printing because of lower production costs and excellent photograph reproduction. In December 1964, it was estimated that 2,000 of 11,000 dailies and weeklies were printed

with offset methods compared to 200 firms using this equipment in 1957. Firms using hot metal letterpress equipment are applying new techniques as hot metal pasteup to achieve cost savings. Some small newspapers are making use of contract offset printing shops.

There is anticipated use of keyboard operated teletypesetters, or equipment which converts copy to punched tape used to control linecasting equipment. Linotype operators in firms using teletypesetters are being retrained to operate the keyboard of teletype setting machines. Data from punched tape can be sent by teletype to newspapers in other cities, reperforated on tape, and used on tape controlled linecasting machines.

Several metropolitan newspapers are making use of electronic computers. Copy is prepared and edited by conventional methods, retyped on an electric typewriter which simultaneously converts copy to coded paper tape. The tape is fed directly into a computer programmed to automatically justify lines and hyphenate words. Production worker employment has increased annually at 1.1 percent from 1957 to 1962.

Technological changes here appear to reduce the skills required of typesetters. Typesetting machines now can be operated by means of perforated tapes prepared by a perforating machine operator rather than a typesetter. Although the operator must be a skilled typist with a knowledge of typing measurements and terms, he needs much less skill than the printing compositor.

In Banking and Insurance, electronic data processing is also being utilized to reduce routine clerical labor. Most large companies make use of computers in their home offices, with installations in the field as well. Office employment in insurance companies with computers accounts for 60 percent of all insurance carrier employment. Various reading and sensing techniques are being introduced for such mass applications as premium collections. These developments are designed to reduce the input preparation done by such workers as keypunch operators. Employment in insurance has increased at an annual rate of 1.9 percent from 1957 to 1962. In banking, computers and magnetic ink character recognition (MICR) devices will secure wider use to speed up customer service. Banking automation will lead to additional bank functions, including the handling of payrolls and consumer credit check account reconciliation. Banks may ultimately serve as data

processing centers for customers. The need for clerical employees, particularly those in bookkeeping for demand deposit activity, will be reduced, although overall employment is expected to expand to 1970.

In 1962, 40 percent of all banks, including virtually all of the largest banks, were making use of computers. Smaller banks are obtaining the computer services of larger banks. Electronic bookkeeping machines, machines to receive and receipt deposits, and closed circuit TV are other advances in efficiency in the bank area. The annual rate of employment expansion has been 3.8 percent from 1957 to 1962.

In banking, use of electronic data processing equipment has involved sharp reductions in manpower and requirements for a given volume of work. In the demand deposit sector, the need for bookkeepers, proof and transit clerks, and many other routine clerical workers is being substantially reduced through the use of magnetic ink character recognition, electronic bookkeeping machines, and full-scale computer systems. Among the new jobs created are reader-sorter operator, check encoder or inscriber, control clerk, and keypunch operator. A few new jobs for programmers and system analysts are being created at the professional and technician level. About half the people employed in banking--tellers, secretaries, typists, switchboard operators, officers and professional workers--are not expected to be much affected by technological change, and their employment will continue to rise as banks increase their facilities and add new services. (The Bureau of Labor Statistics estimates that bank employment will rise by more than 300,000 between now and 1975, despite the rapidly expanding use of electronic data processing equipment and other innovations.)

In the Bureau of Labor Statistics Study of the introduction of computers into 20 offices, it was found that in a total of 2800 previously existing jobs, 1500 were unchanged, 600 new jobs were created in those same offices, and 700 jobs were eliminated. A total of some 900 workers were either reassigned, transferred, or retrained, many of the latter for higher-grade jobs. In experience that seems typical for most of the economy, employers found it possible to avoid layoffs, employing the natural attrition of the labor force in the above cases to effect the reductions of force of 400 that were dictated by the labor-saving technology. And while the adjustment experiences have been success-

ful, it is quite certain that technology has the effect of making obsolescent specific labor skills while opening job prospects for a new family of skills.

Contrasts in the effects of technology are shown in the changing occupational distributions of the petroleum and baking industries, as seen in Table 18. In the petroleum refining industry, between 1950 and 1960, laborers decreased in number and proportion, whereas craftsmen and professional workers increased. The increase in the employment of craftsmen resulted largely from the growing amount of maintenance needed in the highly instrumented and automated petroleum refining processes. Employment of technicians was increased because of the greater utilization of automated and computerized systems.

In the baking industry, on the other hand, the biggest increases in proportion of total employment occurred among sales workers and operatives; craftsmen declined as a proportion of the total. The decline in the relative importance of craftsmen is attributable to the introduction of continuous mixing units and modernized ovens in which products are baked while passing through the oven on a conveyor. In addition, because perishable items can be frozen, they are produced in much larger quantities, contributing to the reduction in the relative number of skilled bakery workers required. The increase in sales workers is related to the greater number of driver-salesmen required to handle the much larger volume of bakery products. The increase in proportion of semiskilled workers resulted to a great extent from the large expansion in the number of truck drivers--more than offsetting the decrease in operatives needed because of the introduction of automatic slicing, packaging, and other machines.

The change in technology in the telephone industry has resulted in an occupational shift different from those previously described. Table 19 shows that the greatest shift has been the decrease in the proportion of telephone operators and other clerical workers, resulting from the conversion from manual systems to automatic dial services for local and long distance calls, and the introduction of automatic timing and billing devices. At the same time, linemen, telephone installers, and repairmen have increased because of the growing number of telephone as well as the complexity and growing volume of telephone services.

Dramatic technological changes have taken place in farming, resulting from increased mechanization, the use of scientific methods, chemical fertilizers, better seeds and so on. Significantly, from 1950 to 1960 farm employment decreased by about 40 percent, but the number of professional workers in agriculture rose by about 20 percent. Such workers include airplane pilots (for crop dusting), scientists, foresters, accountants, veterinarians, and so on.

SUMMARY AND CONCLUSION

What general conclusions might one make regarding the impact of technical change for the economy generally and for Orange County specifically? First, it is difficult to determine the ultimate impact of technical change on the level of employment and the 'skill mix' required of labor. As Ewan Clague has observed:

> A new technology (whatever form it takes at a particular time and place) smashes into the inert mass of existing economic practices and scatters them in all directions. The ultimate effect is not only variable; it is literally unpredictable.[1]

Much of the existing evidence is provided by Department of Labor studies which may not be a sound basis for generalizations about the manpower effects for the entire economy. Indeed, they may well give the impression that technical change is proceeding much more rapidly than is actually the case, since the focal point for such study is, more often than not, an industrial activity undergoing rapid process innovation. While 'islands of mechanization' are the focal point for study, the uneven adoption of new engineering techniques increases the labor-absorption possibilities for industry.

It is clear that the introduction of technology creates 'bottlenecks' for specific skills, while generating labor surplus for other occupations. The fundamental challenge facing educators is to identify those worker traits that maximize the 'skill transferability' capacities for employees. With the introduction of electronic computers, for example, in a key tabulation unit one can find working side by side employees whose jobs are disappearing and those whose jobs are expanding.

Unhappily, the skills which make a worker a good punch-card operator are not those required for a good statistical programmer. There exists what Ewan Clague has labeled the "occupational gap."

Obviously, educational activity in Orange County must become increasingly concerned with this adjustment process. It must develop innovations for measuring not only manpower needs but also the cultivation of skills or attributes

[1] "The Impact of Technology Upon Manpower," Chamber of Commerce Paper given at the Philadelphia Chamber of Commerce, January 10, 1963, processed.

that are most easily modified to serve those needs. The student population must increasingly be represented by mature men and women with considerable work history who must be 'recycled' through the educational process to preserve their opportunities for making or enhancing the contributions to society.

A further theme emerges from the Department of Labor case studies of technology: there is considerable need for accommodation to job activities that 'enlarge' conventional duties. This indicates the need to identify "fundamentals" that have multi-service applications in broad areas of labor activity. For example, business machine servicemen need a broader technical knowledge than ever before--especially of electricity and electronics--to service the complex office machines coming into use. Many experienced maintenance electricians must now learn basic electronics to maintain and repair the complex new equipment being installed. More complex modern metalworking equipment is raising the technical skills required of tool and die makers, and a knowledge of mathematics, the basic sciences, electronics, and hydraulics is becoming more and more necessary to perform this work. The work of appliance servicemen requires greater skill than ever before and a good working knowledge of electricity and electronics, because of the growing use of electric control devices in household appliances.

There is, of course, a considerable debate on the net impact technical change has on the skill requirements of industry. We need not be concerned with all of the elements of that debate here; but it is certain that change itself is the 'constant' that will characterize manpower demands in Orange County. The adjustments required of labor are complicated because of up-grading or down-grading of job requirements and because emerging functions required of labor may be radically different from existing single-purpose skills. But the high-skill activities that offer a greater number of job opportunities impose, concurrently, the greater demands for adjustment. As Ewan Clague has summarized the need for labor's 'adjustment' capabilities:

> Employers prefer the worker who can not only perform the immediate job, but who can learn quickly to operate new equipment or perform new functions as the skill mix changes. The girl who can shift easily from check sorter to key-punch operator, to tape-punch operator, to coder, to edit clerk is likely to be continuously employed by one firm or in demand by other employers. Similarly, the young man who can read a bill-of-lading, follow instructions for loading a truck,

use judgment on size of loads, and exercise caution in handling fragile articles will surely be a good candidate for operator of a fork lift or other mechanized equipment when it is introduced by his employer. On the other hand, the laborer who has only strength to offer is likely to join the ranks of the unemployed when mechanized equipment takes over material movement.

CHAPTER V

APPLICATION TO SPECIFIC OCCUPATIONS

While previous chapters have dealt with more general factors related to students in these junior colleges, the economy of the business and industry of Orange County, or technological change as it involved employment possibilities, this chapter will attempt to introduce more information about specific occupations pertinent to the County.

What have been the trends in growth of occupational groups for Orange County during recent decades? It will have been noted in Table 8 of Chapter III that there was considerable change in the employment among major industrial groups from 1940 to 1960. Table 20 gives comparable data by major occupational groups. Between 1940 and 1960 it will be noted that there was a six-fold increase in the employment force of the County. The proportion of this force increased dramatically in clerical-sales workers and in professional and semi-professional workers, with a somewhat smaller proportionate increase in craftsmen. All other major occupational groups showed proportionate decline, this being particularly dramatic for farmers and farm managers, domestic workers, farm laborers, and other laborers. However, even with proportionate declines in many of these occupational groups, the total number of individuals employed in each has shown startling growth in all groups except those involved with farming, where slight drops are noted. That continued rapid growth has taken place since 1960 was noted early in Chapter III, with the greatest impact on manufacturing, wholesale and retail, services and government.

Occupations in Business and Management and Trade and Technical Fields:

Of particular import to the junior colleges in curricular planning for occupations are the vestibule jobs through which entrance is normally made into business and industry, the pattern of normal advancement during the first years, and the complex of personal and skill qualifications which are essential to gain the entrance positions and subsequent advancement. To prepare for positions not normally available to new employees, to neglect skills and attributes essential for advancement, or to omit consideration of other qualifications would be a disservice to students and to the community.

TABLE 20

EMPLOYMENT STATUS AND MAJOR OCCUPATIONAL GROUPS OF RESIDENTS
ORANGE COUNTY
1940, 1950, and 1960

n.a. means not available.

Note: Employment estimates are averages for the respective years.

Source: U.S. Department of Commerce, Bureau of the Census.

With this in mind, a number of the most representative major business and industrial employers of the County were asked to provide evidences which might bear on these matters. Rather than statistical, the nature of these surveys was by informal interview to gain what is, in effect, a series of case studies. It should be noted that these inquiries were directed specifically to occupational preparation in the junior colleges.*

A Sample Survey

An analysis of the information gathered from the interview sample of employers in Orange County leads to the conclusion that at least three broad directions for training are being emphasized. These appear to divide themselves into human relations, technical competencies, and academic subjects.

Those organizations involved in service activities with the public stressed need for the following when responding to the question:---"What skills and understandings should the employee have at the time of hiring?" "Accounting background and/or business administration majors, in addition, the biggest need is public relations skills or human relations courses--- There will be more emphasis on public relations. The banks will have to make more personnel service available to the public."

A second corporation responded that ". . . the success of the business using service help is dependent upon the ability of the service employees. Training needed in grooming, voice, personality, social sciences, (psychology, sociology, etc.) practical mathematics, job techniques, human relations, economics." Service personnel were listed for this corporation as "security, office/clerical, technical maintenance, and food service."

The area of technical skills seems sharply focused on the field of engineering. An industry representative interviewed stated that 4,000 engineers were now needed in Southern California and that imports from foreign countries were now being utilized. A second industry reported---"Jobs that require completion of two years of college or specialized technical training and experience are more difficult to fill. Currently, the company is in need of people who have

*More detailed information from these interviews and other sources has been given to the junior college districts involved in this study.

an AA degree, 2.5 Grade Point Average (GPA) and a broad background in math, chemistry, and physics. Such an individual would be hired as an assistant engineer, trained by the company and given supervisorial responsibilities. Last year they could have used twelve people in this area and were able to hire only four." Draftsmen are reported as being in critically short supply in the space industry.

Consistent reference is made to the need for automatic process control technicians, individuals with a knowledge of computer and data process applications. In answer to "What skills and understandings should the employee have at the time of hiring?" an electronics firm replies, "A thorough knowledge of fundamentals is desired, an awareness of computer uses also would be extremely helpful to all skilled fields. In this facility, all management personnel have been company trained in the use and application of computers in order to install an attitude of operating efficiency and watchfulness as to possible automation application." Another organization replies, "We expect increased mechanization and automation of our personnel, supply, disbursing, and accounting functions resulting in additional need for Digital Computer Systems Analysts and Programmers."

In summary of these general areas, human relations, technical competence and academic subjects, industry seems intent upon recruiting individuals with broad backgrounds underlying specialized skills. Most of the industries contacted maintain some forms of on-the-job training but are looking for "good communications skills (English, writing, speaking, and broad background appreciation coming from literature) and ability to reason quantitatively."

The entry positions listed by the various employers contacted provide direction for training. Demand is directly related to skill level with no recruiting difficulties for low skilled jobs. The entry positions listed in Table 21 are those given by the sample of employers interviewed. All jobs listed are rated as jobs available to junior college graduates.

Trends reported by the sample of employers with regard to needed competencies are as follows:

1. More emphasis on public relations; more personnel service to the the public.

TABLE 21

ENTRY POSITIONS IN A SAMPLE OF EMPLOYERS SURVEYED

Business and Management:	Trade and Technical:
Management Trainee	Mechanics
Secretary XXXX[1]	Mechanical leadmen
New Account Clerk	Shop supervisor
Teller	Junior Supervisor
Clerk Typist XXX	Production planning
NCR Proof Machine Operator	Production leadman
Statement and Safety Deposit Clerk	Production leadmen: trainees
Purchasing X	Quality control technicians
Scheduling	Lab Technicians
District Sales representative	Draftsman X
Clerk Office XX	Electronic Technician XXX
Data Processor Operator	Sheet Metal Worker
Business worker: PERT	Equipment maintenance
Cashier	Engineering Technician
Service representative	Electrical Technician
Clerk: Accounting	Assistant Engineer
EAM Operator	
Card Punch Operator	

[1]X equals the number of compies in the sample who mentioned this particular need.

2. Fewer but more qualified office-clerical and manufacturing employees. More skills in distributive fields.
3. Increased demand toward automatic process control technicians; more computer and data processing knowledge.
4. More automatic control skills; technical skills; computer influence.
5. Managerial skills---ability to handle fewer employees using specialized equipment.
6. New systems and machines, business machines; data processing accounting.

Of further use as an indicator for curriculum development are the lists of skills and understandings developed by each of the firms in the survey sample. Duplications occuring in the combined listing may serve as indicators of broadness of demand.

1. Accounting background and/or business administration major. Public relations skills or human relations courses.
2. Good verbal and English skills, minor knowledge of organizing and management, accounting, business machines.
3. Shop math, electrical machine repair, lower engineering, general business.

4. Supervisor and management skills, mechanical, math, report writing.
5. Purchasing, math, office practice, organization and management, wholesaling, retailing, display, advertising.
6. Math, English, management and organizational theory, principles of supervision, quality control, labor laws, cost control.
7. Math, statistics, production programming, report writing, organization and management.
8. Typing, spelling ability, some shorthand.
9. Transfer major curriculum.
10. Thorough fundamental knowledge.
11. Awareness of computer uses.
12. Mature awareness of professional attitudes; willingness to contribute to team effort.
13. Specialized skills, good liberal arts, communications, literature.
14. Basic skills; open mind and willing to adapt.
15. Math-science oriented or aptitudes.
16. Business and commercial, card punch and EAM, sales checker, computer operating and programming, blueprint reading, trade theory, use of basic tools and equipment, related math, shop practices.

Summarizing, the business and management area, supervisory and management skills, including personnel relations, was mentioned most often. The second most important trait was the ability to write reports clearly, with accurate spelling and related verbal abilities. Mathematics, which has, of course, general applications to both business and technical operations, was rated as equally important with communication skills just mentioned. Other business and management areas suggested for development included:

Accounting
Human Relations
Business Machines
General Business
Purchasing
Office Practice
Wholesaling
Retailing
Sales checker
Labor Law
Cost Control
Statistics
Production Programming
Typing
Shorthand
Awareness of computer uses
Communications

In the technical areas, the following were mentioned as areas requiring additional attention:

Electrical
Machine repair
'Lower' engineering
Mechanical skills
Quality control

Milling and Baking
Blueprint Reading
Uses of basic tools and equipment
Shop practices
Trade theory

Occupations in Government:

It was noted earlier that government is a major employer, with an employment increase of 19,100 in Orange County between 1960 and 1965. This is distributed between federal, state, county and local jurisdictions, including cities and school districts. This study has been unable to make a detailed analysis of governmental employment as it relates to occupational preparation in the junior colleges, but is has ascertained that many jobs, particularly at the county and municipal level, are appropriate to this study. The vast range of occupations involved may be judged by the fact that Orange County government alone has approximately 600 different job classifications. Most of these parallel occupations in the private sectors of the economy, with some exceptions such as in law enforcement.

County governments of California generally employ very heavily in the following occupational fields: social worker, law enforcement, nursing, probation officers and civil engineering. These are followed closely by: tax appraiser, juvenile counselers and medical personnel. Table 22 presents a list of selected occupations employed by Orange County, together with the number of positions budgeted in 1964-65 and an estimate of the added number of positions which will be needed in 1974-75. It will be noted that for most of these occupations the number of employees needed will be doubled in this 10 year period. With rapid growth, similar trends no doubt will be evident in other occupations and in other governmental jurisdictions.

Orange County reported in January of 1965 that it was having particular difficulty in recruiting personnel in the following fields: occupational therapy, physical therapy, medical records library, medicine, psychiatry, dentistry, clinical psychology, medical social work, psychiatric social work, dairy livestock inspection and toxology.

TABLE 22

SELECTED OCCUPATIONS USED IN THE GOVERNMENT OF ORANGE COUNTY, WITH NUMBER OF POSITIONS BUDGETED IN 1964-65 AND THE EXPECTED ADDED POSITIONS NEEDED BY 1974-75.

Occupation	Number of Jobs Budgeted 1964-1965	10 Year Projection Estimated Number of Positions Over 1964-65
1. Clinical Lab Technology	26	26
2. Microbiology	14	14

16. Agriculture Inspection	34	0
17. Civil Engineering (includes Draftsmen)	80	80
18. Sanitation	41	40

SUMMARY

There is no reason to believe that the rapid growth and trends of recent decades will not continue to a considerable degree in the major occupational groupings of people employed in Orange County. Many of these occupations are appropriate for junior college curricula. The survey of a selected group of larger employers of the County gives added evidence of the importance of the occupational programs of the junior colleges and the need for broadening much of the training to include essential academic background, desirable personal development and broader occupational skills than have been expected in the past. The growing opportunity for employment in occupations in government should challenge the junior colleges to added preparation in areas related thereto. Attention should be given also to occupational curricula in recreational work and in occupations in the maritime field.

From the data thus far presented and with due respects for the limitation of this preliminary study, some increased emphasis on curricula in occupational areas is suggested.

Occupational Area No. 1 - Business and Management:

1. Secretarial and Stenographic.
2. General Business Management.
3. Data Processing.
4. Accounting and Bookkeeping.
5. Sales and Retail Merchandising.
6. Hotel and Restaurant Management.

Occupational Area No. 2 - Trade and Technical:

1. Drafting.
2. Electronics Technology.
3. Auto Mechanics and Diesel.
4. Building Construction.
5. Surveying Technology.
6. All-around Machinist.

Occupational Area No. 3 - Health Services:

1. Dental Assisting.
2. Registered Nurse.
3. Medical Assisting.
4. Licensed Vocational Nurse.
5. Medical X-ray Technology.

Occupational Area No. 4 - Other Services:

1. Police Science.

Occupational Area No. 4 - Other Services, continued:

2. Cosmetology.
3. Homemaking.

Occupational Area No. 5 - Applied and Graphic Arts:

1. Art.
2. Advertising Art and Commercial Art.
3. Publishing and Printing.

Occupational Area No. 6 - Agriculture, Horticulture, and Forestry:

1. Agri-business.

There are no doubt many others, and in some Occupational Areas these may be almost self-evident. Such may be the case in Occupational Area No. 4 with respect to a possible two year terminal occupational curricula in Fire Science to help develop competent personnel for the increased fire danger which is a by-product of heavy population concentration in Orange County. The second phase of this study should give particular attention to this and other special areas.

CHAPTER VI

OBSERVATIONS

From the several types of evidences included previously in this report, a number of observations seem pertinent.

While in past generations the word "skill," as applied to occupations, referred largely to manual skills and use of neuro-muscular adaptions, today's and tomorrow's skills increasingly involve the intellect.

The dichotomy of vocational - academic has largely disappeared. There are very few occupations today, particularly economically productive occupations, which do not require an extensive background of formal academic study. This is particularly true if one is to avoid "blind-alley" jobs. Employment of the present and of the future is increasingly dependent upon further education with sufficient background in several areas of study and experience to give maximum adaptability for promotion and the change in technology.

Taking all of these into consideration, occupational preparation in the junior college should increasingly be welded into an adapted lower division program, suitable for employment upon completion of the AA degree, and also suitable, with a minimum of loss of credit, for continuing through a baccalaureate degree, probably on a part time basis while employed. The growing youthfulness of the population of Orange County further supports the idea of junior college responsibility for occupational and general educational preparation.

Monthly studies of labor market adjustments for Orange County could probably give counselors an appropriate 'sense' of county employment trends which would be helpful in counseling youth effectively.

Small employers (nine or less employees) will be dependent upon junior college occupational programs for obtaining competent workers. These small employers can do little or no in-plant training because of their limited resources.

Work-experience education programs would seem to offer considerable promise for junior colleges. These programs, involving close cooperation between schools and business and industry, offer youth an opportunity to try out their talents in their chosen fields while still in school. Cooperative educational programs give youth occupational training in very real job situations with up-to-date equipment and the most recent job techniques. Furthermore, these programs can help youth to learn how to get along with people in a working relationship.

The study of the distribution of business and industrial firms by city areas within the county can give valuable suggestions for the location of occupational curricula in certain junior colleges and thus avoid unnecessary duplication of staff and facilities. Students should be able to transfer readily among junior colleges to follow specific curricula located in only one or two places.

The continued use of advisory committees for the occupational curricula is highly desirable. These committees, however, might well be selected on an industry wide basis rather than from a single trade to produce a broad point of view among the members. Members might well be chosen on a county wide basis, too, for a similar reason.

The continuous study of economic trends in Orange County seems to be a necessity because of its rapid development. Information obtained from such study should undergird curriculum planning. For example, it has been ascertained that there is a declining need for production labor in the oil industry in the county and that hence the fine program in Oil Technology at Orange Coast College will probably suffice for a long time and should not be duplicated in other junior colleges. A central clearing house of information obtained from economic studies might be very helpful if such an agency could be set up in a way so as to produce information readily translated into meaningful suggestions for curriculum planning.

In any planning for the development of occupational curricula, the concept of families or related jobs should be considered. For example, occupations in the health services field such as dental assisting, nursing, and medical x-ray technology might have a common core of subjects and thus be grouped into one instructional unit. The same principle could apply to other families of occupa-

tions such as secretarial, stenographic, general business, and data processing. Further groupings into families of occupations might be possible.

Data from this study from which recommendation for building purposes can be made are somewhat limited. Consideration should, however, be given to providing space for classrooms and laboratories for: electronics and precision instrumentation; retailing and wholesaling (the distributive education program in vocational education); hotel, motel, and restaurant management; data processing; professional and practical nursing; police work, fire prevention and control; sanitation; and possibly others. It is desirable that in the construction of vocational-technical buildings consideration should be given to the idea that a large building with few weight-bearing partitions should be constructed in order to provide for the greatest internal flexibility for rearrangement of classroom and laboratory space to provide for the changes in occupational curricular offerings.

Further investigation needed:

It is hoped that this preliminary work will lead to the second phase of this study and have as its objectives the following:

1. To develop an occupational profile for a rapidly-changing regional economy.
2. To develop devices for translating the occupational-industry matrix into projections that could be made quarterly, with minimum effort, of future occupational requirements in the area.
3. To develop indexes of labor supply and labor demand that would serve as a guide for educational policy, curriculum design, and counseling activity.
4. To analyze the family of employee skills identified with job success for the junior college graduate.
5. To analyze job histories and patterns of vocational experience that might be explained by vocational and technical training.

Much literature and some research exists in the occupational curricula area, and in a future study this information should be brought together for the benefit of the junior colleges in Orange County.

The findings and observations of this report appear to agree with the many recommendations made by Dr. Grant Venn in the study he prepared for the American Council on Education entitled, Man, Education and Work, A.C.E.

1964. Particularly appropriate for the concluding remarks of this work are recommendation number four, p. 113, "Higher education should assume a greater responsibility for the education of youth and adults for occupational competence in the technical and highly skilled occupations at the less-than-baccalaureate level;" and number five, p. 165, "The two-year colleges in America, if they are to assume their proper and effective role in the educational system of the nation, should make vocational and technical education programs a major part of their mission and a fundamental institutional objective."

Dunn, William A.
Report on the Summer Institute for Administrators and Supervisors of Technical Education, (3rd, Oklahoma State Univ., June 7-18, 1965).

Oklahoma State Univ., Stillwater
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 65 26p.

*TECHNICAL EDUCATION; *PROGRAM ADMINISTRATION; *SUPERVISION; *SUMMER INSTITUTES; ADMINISTRATIVE PERSONNEL; PROGRAM PLANNING; CURRICULUM PLANNING; EDUCATIONAL FACILITIES; INSTRUCTIONAL STAFF; EDUCATIONAL NEEDS
*SUMMER INSTITUTE FOR ADMINISTRATORS AND SUPERVISORS OF TECHNICAL EDUCATION, STILLWATER, OKLAHOMA, JUNE 7-18, 1965

The main objective of this institute was to give administrators of technical education programs an insight and some firsthand knowledge on how to improve existing programs and develop and start new programs. Nineteen administrators and supervisors from 14 states attended. Discussion was restricted to engineering-related technical programs in the investigation of 12 areas of concern. Maurice W. Roney of the host institution, presented (1) "The Elements of Long-Range Planning in Education," (2) "Identifying and Publicizing Technical Program Needs," (3) "Program Planning," (4) "Curriculum Design," (5) "Mathematics in the Technical Curriculum," (6) "Science in the Technical Curriculum," and (7) "Evaluation and Accreditation." Consultants presented "Providing Facilities for Technical Programs," "Staffing a Technical Program," "Financing the Technical Program," and "Research in Technical Education." A bibliography for technical program planning includes 41 items dated from 1950 to 1964. (EM)

FOREWORD

Technical education is a rapidly expanding part of our public education services in the United States. Growing out of the pioneer efforts of public and private schools throughout the country, a distinctive pattern of technician training is emerging. Post high school programs, two or more years in length, have developed a form and function, unique in many respects, serving a group of people who find that neither a traditional baccalaureate degree curriculum nor highly specialized skill training meets their needs.

The Oklahoma State University Summer Institute series was established in 1963 to bring together experienced technical education personnel who have common administrative problems. The 1965 institute was devoted to a study of technical program planning and operation, utilizing the combined experience of the participants and selected specialists who served as discussion leaders.

This summary report of the conference was prepared by William A. Dunn, Assistant Professor of Engineering at Pennsylvania State University. Detailed reports for each of the major subject areas dealing with administrative planning were prepared by sub-groups at the conference and duplicated for the participants use.

M. W. Roney, Director
School of Industrial Education
Oklahoma State University

REPORT ON
THE THIRD SUMMER INSTITUTE FOR
ADMINISTRATORS & SUPERVISORS OF TECHNICAL EDUCATION

This third summer institute for administrators and supervisors of technical education was held in the delightful and relaxing atmosphere of Oklahoma State University at Stillwater, Oklahoma, during the period from June 7 to June 18, 1965.

There were 19 attendees from all parts of the country representing 14 different institutions - all with a common purpose - to provide the best technical education programs that their faculty and facilities would permit.

The main objective of this institute was to give these administrators of technical education programs an insight and some first hand knowledge on how to improve existing programs and how to develop and put into operation new programs when the need arises.

This was accomplished by investigating the following twelve areas in detail:

1. The Elements of Long Range Planning in Education
2. Identifying & Publicizing Technical Program Needs
3. Program Planning
4. Curriculum Design
5. Mathematics in the Technical Curriculum
6. Science in the Technical Curriculum
7. Administrative Organization
8. Providing Facilities for Technical Programs
9. Staffing a Technical Program
10. Financing the Technical Program
11. Evaluation & Accreditation
12. Research in Technical Education

It should be pointed out here that this institute restricted its thinking and discussion to engineering-related technical programs.

The time spent in investigating each of the 12 areas varied widely. As one might suspect with a professional group such as this, lively discussions developed and time was all too scarce. However for each topic there was a committee of three appointed to write a summary report of the deliberations. These were dittoed and distributed to the attendees and could be obtained by interested parties by writing to Professor Roney at Oklahoma State University. They are not included with this report because of the length of time involved in preparing and assembling the additional copies that would be required and the report would then be too voluminous.

In most of the sessions Professor Roney presented the material and led the discussion that followed. However, in several instances, resource personnel were utilized. This was done because these resource people are experts in their particular field and devote their major professional efforts to that field.

The material that follows is a recapitulation of the deliberations of the institute with each of the 12 topics discussed separately.

The Elements of Long Range Planning

In the area of long range planning it was found that the most logical approach could be developed by looking at some elements that go into all successful educational plans. These include philosophy, objectives, programs, organization, staffing, facilities and financing of a particular program. It was the consensus that these should be looked at in light of the administrators home institution preferably in the order listed. However, practicalities sometimes dictate that the order be scrambled in many different ways. For instance you may have a staff that must be used in new programs, you may have certain facilities that will have to be utilized, your finances may be very restricted - in other words - it's the old "which comes first, the chicken or the egg" approach that may have to be used.

The group agreed that the ideal long range plan could best be developed by answering the following questions in the order listed:

A. PHILOSOPHY

1. What are the educational needs of a free society?
2. Who should be educated, to what extent, and by whom?
3. What new knowledge and skills are required?

B. OBJECTIVES

1. Which of these general educational needs should this institution seek to meet?
2. What group or groups should it serve and what changes in their knowledge, skills and attitudes should it try to bring about?

C. PROGRAMS

1. What instructional programs, research programs and service activities will best serve the needs selected?
2. What range and intensity of coverage is required?
3. What curriculum content and educational methods are most appropriate?

D. ORGANIZATION

1. What human abilities, knowledge and skills are required in order to carry out the selected programs and activities?
2. How can these required abilities, knowledge and skills best be translated into requirements for specific faculty, research, administrative and non-academic positions?
3. What functions, responsibility and authority should be associated with each position?
4. What inter-relationships should exist among the different positions in order to best achieve the institution's objectives?

E. STAFFING

1. What numbers, kinds and qualifications of people are required to fill the positions and assume the responsibility in order to best carry out the selected programs and activities?

F. FACILITIES

1. What numbers, kinds, quality and locations of facilities are required to best enable the staff to carry out the desired programs and activities?

G. FINANCING

1. What operating and capital funds are required to provide the necessary staffing and facilities, and where and how can these funds best be obtained?

Identifying & Publicizing Technical Program Needs

All indications point to the fact that well qualified engineering technicians are in short supply at the present time and will be needed in ever increasing numbers in the future. Many institutions find it difficult to identify the particular program needs in properly fulfilling their educational obligation to their respective communities.

It was felt that basically the demand for a new program comes from the industry or industries who would employ the graduates of the program. This demand can be crystallized by normal contact with personnel people in placement

departments within the industrial complex who come to your school to interview graduates of other programs, by the relationship between the school people and industrial people and by alumni from the schools who are working in industry and see the needs of the industry from the industrial side after having been through another educational program.

After the need for a program has been determined, surveys of industry are important to determine job functions of the graduates. Many times job titles are used and this leads to confusion and the development of a program that misses its intended objective. In conducting this type of survey it is extremely important that the people conducting the survey are completely oriented and well versed in it. From the public relations standpoint it is desirable to get many people in as many industries as possible involved.

One must be cognizant of existing programs in the same field and must determine if there is need for additional programs of the same nature if others do in fact exist.

Once the need for a particular program has been determined, school population studies from a quantatative point of view should be conducted to see if potential students are available.

The program must now be publicized and this can be accomplished by conventional means of news media - newspapers, radio and television. In addition brochures and catalogs are utilized as well as motion pictures and recorded film strips.

Personal contact with students and schools are a must as well as industrial visits. It is very important that high school guidance counselors understand the program completely and that all questions from parents and high school students be thoroughly and honestly answered.

Program Planning

Once the need for a program has been established and it is determined that students are available to take it, then the program planning phase comes into focus.

It was felt by the group that we should be preparing the student for several entry jobs in a particular field. This could best be accomplished by having the program broad in nature - mechanical, electronics, civil, etc., rather than too specific - servo-mechanisms, fixture designs, T.V. circuits, etc. In addition, the program should be so developed that graduates are prepared to advance to positions of increased responsibility as they gain on-the-job experience. The program should prepare the individual for further study in his chosen field and develop in him a sense of social responsibility. The subject matter that one hopes will accomplish the above goals will be discussed under Curriculum Design.

The program should be planned for capable, average students with rather specific entrance requirements. These would include:

1. High school graduation or equivalent

2. Two years of math - preferably one year of algebra and trigonometry would be desirable.

3. Three or four years of English

4. One year of laboratory science. Lab experience is all important here.

In addition some "shop" experience and perhaps some drafting would be helpful. Intense interest in the particular field and a willingness to work are assumed.

In some instances it may be desirable to think in terms of cooperative programs. If there is a dire shortage of technicians and the need is immediate, an agreement can perhaps be reached with industry where the individual goes to school and works on alternate weeks, semesters, etc. There are instances too where lab facilities are not available at the school but are available in industry--here a cooperative arrangement can work out very satisfactorily.

Supplementary and extension programs should be included in one's planning for those craftsmen who wish to become engineering technicians and for those practicing technicians who wish to avoid technical obsolescence. For this type of program industry offers a wealth of teaching talent on a part-time basis.

Curriculum Design

Of all the areas investigated in this Institute, this one seemed to create the most interest and was perhaps the most controversial. As Professor Roney pointed out when the discussion on this phase began, there has been very limited research done on this subject and there is a definite need for it.

We have been bound in the past by traditional concepts such as the transfer of learning theory, the building block concept, the single teacher concept and/or a combination of them. These are all excellent concepts and are tried and true in traditional educational programs but in technical programs to prepare engineering technicians, they just don't fit as well as they might.

Other problems that creep into the picture and perhaps bias ones thinking are the compromises with transfer credit, the institution's entrance requirements and accreditation standards. This is not to imply that these are necessarily stumbling blocks, the fact that they have to be considered may help to make a stronger program.

It would be ideal if one could choose his staff after the program has been developed. However, there are occasions where an existing staff has to be used and this can create problems in curriculum design.

Facilities and monetary limitations can be influencing factors and the dominance of a particular company or industry may be present and affect the curriculum.

A curriculum for this area of education should include:

1. Technical specialty courses - basic and advanced courses from the particular technology

2. Mathematics

3. Science

4. Auxiliary and supporting technical courses (engineering graphics, etc.)

5. General Education courses, humanities, social studies, etc.

Three illustrative curriculums are listed. It should be pointed out that these were developed by experts in this field, working independently. (Note the general agreement)

Subject Matter	Curriculum Source and Credit Hours		Tech. Ed. in ***Jr. College
	*USOE	**ASEE	
Specialized Technical	35	33	30
Mathematics	9	12	10
Science	9	6	10
Auxiliary Technical	7	6	6
General Education	11	15	18

*Occupation Criteria & Preparatory Curriculum Patterns in Technical Education Programs. O.E. 80015 USOE

**Characteristics of Excellence in Engineering Technology Education - ASEE

***Technical Education in the Junior College - Harris

Much discussion was devoted to the principles of curriculum design. These six principles follow:

1. Early introduction of the technical specialty by one or two major courses in the first semester. This is done for two basic reasons:

   a. To motivate the student

   b. With only 4 or 5 semesters available, they must come early to provide for sufficient depth in the total program.

There was considerable discussion and lack of general agreement on this latter point. Generally it was agreed that it is desirable to introduce the technical specialty as early in the program as possible. However, it was not agreed upon the amount of mathematics, general education and auxiliary courses needed nor when they should be introduced. It was agreed that the optimum condition would be perfect coordination between all courses including the specialties; regrettably this is not always possible or practical. Several charts from Professor Roney's prepared material were used to demonstrate the problems in simplified form.

2. Auxiliary technical courses must be included to broaden the student's understanding of the particular technology he is studying.

3. Mathematics & Science courses should be closely coordinated with the technical courses in the curriculum to introduce concepts and theory when needed.

4. A minimum of 30 credit hours of specialized (technical) course work should be included.

5. Student load:

   There should not be more than five (5) courses per semester. Credit hours should be around 18 per semester with 28 to 30 contact hours per week with a total of 50 to 54 hours of class, lab and study per week. (This is based upon the rather standard rule of requiring 3 hours per week of student effort for each credit hour in college level work. If a class is strictly lecture, two hours of outside preparation are required for each one in class. In a laboratory situation, normally three hours are required for each credit hour. If a lab is 3 hours in length, little if any outside work is necessary. If it is two hours in length, one hour outside is usually necessary for writing the report, reading instructions, etc.)

6. Provision should be made for either individual or small group problem work during the final term. This is to promote independent thinking and to test each individual's comprehension of the total curriculum content.

It is suggested that each individual read Professor Roney's paper on Curriculum Design in Technical Education.

Mathematics in the Technical Curriculum
and
Science in the Technical Curriculum

Because of their close relationship to one another and the fact that they are necessary and mandatory to the understanding of the technical and auxiliary technical courses, mathematics and science in technical curriculums were discussed together. The math situation was looked at in considerably more depth than the science grouping.

There are two approaches to the math sequence in technical education cirriculums. One is to integrate the mathematics with courses in science and technical specialties and the other is to teach math as a pure science. In the latter, the math courses are usually taught by the math department and are taught with few problems illustrating the applications of the principals. The objective of this type of program is to teach the level of math necessary to prepare one for more advanced math. True, this type of math identifies concepts and formulas, but it does not provide the application vital to the success of the practical technician's career. This approach was not felt to be adequate for technical education programs so the discussion centered on the integrated approach.

In this method of teaching math there is a correlation of the math and the technical courses. The advancement in mathematics and the advancement in the technical courses parallel each other. Here the student has math instruction plus the reinforcement of learning that comes from the application of mathematics in the technical courses.

The amount of mathematics and scientific courses in a curriculum depends upon the determined needs of the technology. However, it may be generalized that most curriculums would include 9 semester hours of math and 6 semester hours of science (see section on Curriculum Design of this report).

The objectives of mathematics (and science to some extent) were found to be threefold:

1. Mathematics & Science are foundation courses in the curriculum. These disciplines may be thought of as foundations for the further interpretation of the technical subject matter.

2. The study of mathematics and science may be viewed as a foundation for continued study after the completion of the two year program. These are, of course, differences of opinion as to the validity and worth of this position, but when one views the ever changing nature of the technician, the worth is obvious.

3. Mathematics has a major part in communications of skills.

Curriculum studies by Professor Roney of 35 ECPD approved curriculums in 12 technical institutes showed a wide variation of time devoted to courses in mathematics (Range 0 to 13 semester hours). Current thinking seems to indicate about 9 hours as desirable - algebra and trigonometry - 5 hours; selected topics in analytic geometry and calculus - 4 hours.

Desired emphasis is on the use of formulas rather than the mechanics of formula derivation. However the student should be expected to follow derivations of formulas; concepts in algebra and trigonometry should be fully exampled by technical applications. The purpose of the analytic geometry and calculus is to introduce fundamental concepts of higher mathematics. Problem solving using these concepts is limited.

No discussion involving math and science would be complete unless it involved the text and instructor. No one seemed to be completely satisfied with available texts nor is there any one text "most widely used." The group felt that studies leading to the development of suitable texts for this educational level might well be undertaken.

Perhaps as important as the subject matter itself is the availability and selection of qualified instructors. Instructors should have a thorough understanding of the theoretical nature of the subjects as well as the practical application to the technology (This is discussed in more detail in the Staffing Section).

Administrative Organization

There were 19 participants representing 19 different institutions and 14 states at this Institute. The administrative organization at each one was different from the others. Each administrative organization is perhaps peculiar to that school and what may prove to be satisfactory in one school or area may be totally inadequate and unwieldy in another. This being the case it is extremely difficult to generalize and next to impossible to point out or define a typical organizational structure.

Providing Facilities for Technical Programs

The material for this session was presented by Professor H. P. Adams from Oklahoma State University. Professor Adams is known as the "Dean of Technical Institutes" in the Southwest and has had world wide experience in setting up and operating technical institutes; Professor Roney then led the discussion that developed.

It is universally agreed that laboratories are the backbone of Technical Institute education so the discussion centered on this facility.

Practical application of principles in technical training programs is provided through laboratory experiences rather than through traditional shop courses. Laboratories should provide for a variety of engineering and

scientific applications, provide for competency in the use of laboratory equipment, precision measuring instruments and computing devices as well as scientific and engineering handbooks. In addition its functions should include correlation of specialized technical courses with mathematics and science. Each student should be encouraged to develop to the maximum of his ability and capacity.

The technical laboratory must be organized and equipped to permit maximum training in a minimum of time. Following are some general guide lines that will help to achieve efficient laboratory management:

1. Theory classes and laboratory experiences should be closely correlated and preferably taught by the same instructor.

2. Laboratory equipment should support and complement the planned technical program.

3. Laboratory manuals should be used to supplement and expand detailed course outlines and other teaching materials. These manuals should be well planned and thought out to include experiments that are practical in nature.

4. Laboratory time should not be used to teach theory. (At this point, Professor Roney explained that he had onetime seen the following regarding laboratories. "The word should be written LABORatory not labORATORY."

5. Strict discipline of laboratory time is essential.

   a. Lab periods should be a full three hours in length and should be designed on an effective time schedule so that the entire lab period is utilized. If breaks are permitted they should be carefully controlled. If some of the students get their experiments finished early, additional experiments should be assigned.

   b. Instructor-pupil ratio should be carefully controlled - a maximum of 20 students in a lab section is most desirable.

   c. Laboratory sessions should be planned and organized so that a minimum of time is spent in "getting ready" for the experiment.

6. Laboratory exercises and materials should be continuously reviewed, revised and up-graded.

7. The first lab session should begin with an experiment.

8. Staff members should be allowed planning time for developing and testing laboratory exercises and equipment. This can be accomplished by utilizing the summer when classes are not in session and/or giving the instructor released time on an individual basis.

Design considerations and costs were discussed in general terms and Professor Adams passed out some material he had compiled regarding costs, sizes and specifications for classrooms, laboratories and equipment for engineering technology programs. This material can be obtained by writing to Professor Adams at Oklahoma State.

This general design and construction topic was discussed by the group and it was suggested by one of the attendees that a Mr. Michael Russo at the U.S.O.E. could be of help with planning and construction problems. Mr. Russo is in the Vocational & Technical Division of U.S.O.E. in Washington.

The design and cost considerations would be somewhat dictated by the kind and type of program that is to be offered. Space requirements can vary from 45 to 170 square feet per student, so the number of students you plan to have is all important. It was recommended that class sizes be restricted to 40 students and labs held to 20. Naturally the size of the teaching and administrative staff will have to be considered. The planning phase should include lay-outs of shops and laboratories with equipment lists.

When specifying the purchase of equipment, several rules should be followed.

1. Quality is very essential - don't be penny wise and dollar foolish.

2. Equipment should be accurate, well designed and of the type used in industry.

3. Equipment is sometimes available other than by direct purchase. Sources include:

   a. Consignment by manufacturer
   b. Lease-purchase agreements
   c. Rental
   d. Government Surplus
   e. National Industrial Equipment Reserve

It was felt that a reputable architect should be engaged to design the building. Costs can be estimated at $4000 to $5000 per student for buildings and equipment and operational costs range between $1000 and $1200 per student per year.

Staffing a Technical Program

This session opened with a general statement to the effect that any teacher in a technician training program must be first of all technically competent. This is the first prerequisite and this competency comes from educational training and industrial experience, secondly some professional skills in teaching are required, however the kind and amount are debatable.

Professor Roney then introduced Professor Jerry Dobrovolny from the University of Illinois who gave a fine presentation on technical education and teacher training. The discussion which followed centered around sources of teacher for technical institute programs, their desirable qualifications and the strength and weakness of teachers with different backgrounds.

In staffing a technical program it was stated that a 20 to 1 ratio of students to faculty was ideal. In addition to the technical and pedagogical requirements initially presented, it is important that a faculty member of this type of program be familiar with and sympathetic toward engineering technology education.

There is no one source to obtain teachers for this type of program. The varied sources include former members of the Armed Forces who have a technical education and have had technical experience in the Service (Penn State is currently offering a one year NSF Institute for this type of person to prepare him for teaching at the engineering technician level.)

Former engineering college faculty who have an interest in and understanding of this type of education are another source of faculty.

Evening school part-time teachers who are employed in industry and have a technical education background offer another source.

Selected vocational education and industrial arts teachers who can be updated can develop into good teachers in this type of program.

Graduates of Associate Degree programs who have industrial experience and have gone on to get a B.S. degree are a fine source (University of Illinois is currently offering this type of program), as well as Oklahoma State.

Other sources include people with degrees in physics, math or chemistry with industrial experience and a desire to teach.

Quite naturally technical education teachers with different backgrounds have strong and weak points; these have been generalized as follows:

A. Engineers (including industrial and retired military)

1. Strong in technical competency both by degree and experience
2. Weak in pedagogy
3. Weak for this type of program because he may teach at the technical institute level the same way he was taught in engineering college
4. If these people are unemployed in the industrial complex they may have undesirable traits which would prevent their becoming good instructors

B. Vocational teachers

1. Usually strong in teaching methods
2. May be too much project oriented rather than principle oriented in technical subjects
3. May be over-specialized in a narrow field
4. May be academically weak
5. May not be up-to-date technically

C. Industrial Arts teachers

1. Usually strong in teaching methods
2. May be ready and ripe for a philosophical change
3. May be weak in technical specialization
4. Probably will lack industrial experience

D. Technical Institute Graduates

1. Have been through this kind of an educational process and are likely to understand and appreciate it
2. Have achieved success in the profession - as technicians in industry
3. Probably have had additional training through company courses, evening school, etc.
4. May be limited technically because of specialization in a narrow field
5. May be weak in terms of pedagogy and may not understand the educational system of curriculums, administrative problems, etc.
6. May lack and not understand the need for a professional attitude

The above discussion and summation has centered about the teachers of technical subjects in an engineering technology program. Perhaps even more difficult to find are math instructors and instructors for engineering report writing who understand and believe in technical institute education.

Financing the Technical Program

Professor Roney introduced Mr. Robert Knoebel from the Department of Health, Education and Welfare, Office of Education in Washington, D. C., who presented this topic of the Institute agenda.

Mr. Knoebel pointed out that funds for technical institute programs can and do come from the following sources:

1. Local taxation
2. State appropriations
3. The Federal Government
4. Student tuition
5. Gifts in the form of money, services, equipment and supplies
6. Research contracts both government and private.

His main discussion then centered on Federal funds with emphasis on Public Law 88-204, 88th Congress H.R. 6143, December 16, 1963, Public Law 88-210, 88th Congress, H.R. 4955, December 18, 1963. In addition he passed out to the group and discussed the following two publications:

1. Milestones in Education OE-10031-A, U.S. Department of Health, Education and Welfare, Office of Education, Circular No. 761, Washington, D. C.

2. Part 104 Administration of Vocational Education Federal Allotments to States
   Rules and Regulations
   Reprinted from Federal Register, August 28, 1964
   U.S. Department of Health, Education and Welfare, Office of Education, Washington, D. C.

This subject is too broad in scope and too narrow in detail to generalize in this report except to say that all of the Federal Acts & Laws are designed to help educational institutions and programs.

It would appear that these acts and laws are very flexible and can be broadly interpreted. It is suggested that the reader secure copies of these acts and seek expert advise from the State or Federal government if he feels the provisions apply.

Evaluation & Accreditation

This is a subject that is extremely controversial and the opinions of the group were quite divided. The three man committee charged with writing the summary for this topic wrote a very comprehensive, impartial report. The reader is referred to this report from which he may draw his own conclusions regarding evaluation and accreditation.

Research in Technical Education

Professor Roney introduced Dr. J. Paschal Twyman, who is the Assistant Director of the Research Foundation at Oklahoma State University. Professor Twyman is an expert in educational research and presented an interesting and enlightening talk on the subject.

He began by giving his definition of research which is, "Research is a careful, unbiased study of a problem based as much as possible on facts and interpretation and evaluation of data."

Reasons were cited why certain individuals should be interested in and concerned with research; they include:

1. Not enough research has been done in the past in the field of education - particularly in technical institutes
2. Many educators have little or no knowledge of research
3. Many good reports on educational research are available
4. There is a definite shortage of capable persons in the research field
5. Federal funds are available for research. (Public Law 88-210 allocates 10% of the funds for research in vocational education.)

Determining the problem is sometimes extremely difficult. The following questions arise in this determination.

1. Can the problem be stated in such a way that research is desirable? In social sciences it is difficult to measure factors such as attitudes
2. Is it socially significant?
3. Will research on the problem make any difference?
4. Does the proposer of the research have an interest in the problem?
5. Is this problem of general interest to others?
6. Can this research be completed in a reasonable time?
   Types of Research include:
   a. Historical - this is used to determine what has happened in the past

   b. Descriptive - this determines what situation exists at the present time - based on the idea that it is necessary to know where we are now in order to know where to go

   c. Experimental - this determines what will happen in a controlled situation where certain factors are varied

Some general comments included:

1. A researcher must be willing to accept his finding, whatever their outcome. As Professor Twyman pointed out here, many people after they have collected their data and it doesn't indicate what they thought it should, they feel that the research has been a failure and they feel they have to start all over.

2. Once the data has been collected it can be analyzed by:
   a. Statistics - used for summarizing data into a meaningful form for people to use. Allows for probability statements of the reliability of the data.
   b. Description including a summary inference.

3. The Written Report:

   a. The project must be described so that others can understand it.
   b. Sufficient facts must be presented so that others can theoretically repeat the experiment and expect to obtain comparable data.
   c. The report must be written keeping in mind the type of audience that will read it and the type of publication in which it will be published.

Professor Twyman from his position of screening research proposals, indicated the following common errors occurring in many of them.

1. Poor grammar.
2. Lack of specificity of stating the problem.
3. General inconsistency in using words and concepts.
4. Poor literature review for determing what work has been done on the problem.
5. Poor design.
6. Not being realistic in regard to the amount of time required for the project.
7. Not being specific about items in the budget.

There is a publication entitled, "Conditions & Procedures," published by the U.S. Government Office of Education which deals with research contracts under section 4c of Pl 88-210. Mr. Knoebel from Washington, who spoke to us is going to send each Institute participant a copy of this publication.

At this point, the proceedings of the Institute were brought to a close with all participants feeling that the past two weeks were most profitably spent.

It is suggested that readers of this report who were not fortunate enough to attend the Institute write to Professor Roney at Oklahoma State University and obtain the following papers:

1. Laboratory Facilities for Occupational Training
2. Curriculum Design in Technical Education
3. Mathematics & Science in Technical Education

A committee of 63 high school administrators, guidance personnel, and other school administrators, 79 laymen representing industry, business, labor, and the school board, and a team of specialists in vocational education assisted in the study. A total of 32 participating schools represented a population area of 273,756. Questionnaires were returned from 5,758 10th and 12th-grade students in an occupational interest survey. Parents returned 3,318 questionnaires expressing their views of students' plans and expansion of programs in vocational education. Questionnaires received in 1964 from 1,142 1958 ninth-grade students showed that 566 were in college and 576 had discontinued school. Manpower needs and employer viewpoints were obtained from 212 questionnaires and 55 personal interviews. It was recommended that (1) three area vocational-technical centers be established in the three-county area, (2) each center be located so as to serve more than 2,000 students, (3) business education, home economics, and industrial arts courses now offered be continued in home schools, (4) advanced courses in these areas be offered in the area centers, and (5) existing trade, industrial, and technical education courses be transferred to the centers. JOSEPH R. STROBEL
ASSISTANT COMMISSIONER FOR
INSTRUCTIONAL SERVICES
(VOCATIONAL EDUCATION)

November 10, 1964

To the Citizens of Columbia, Dutchess and Putnam Counties:

If educational planning is to reach its optimum level of effectiveness, it must be fulfilled with methods which are democratic and which provide for the progressive participation of all concerned.

Your State Education Department commends your adherence to this principle while undertaking and completing an Area Vocational Study. Your eagerness to identify and make available needed programs of occupational education is a step forward in improving the area's total educational effort. The completion of this study would not have been possible without the assistance of numerous persons and organizations. Boards of education, school administrators, professional school personnel, survey teams and members of the several committees are to be commended for their leadership and constructive contributions.

Increasingly, people at work are required to have advanced knowledge and skills prior to their entry into the labor market. The education of youth, the unemployed and underemployed, will make an increasingly important contribution to the economic welfare of your agriculture, business and industrial communities.

This report should be a helpful guide for the establishment of needed area programs of occupational education. We join you in your aspiration for the early realization of greater educational opportunities for the youth and adults of Columbia, Dutchess and Putnam Counties.

Sincerely yours,

Joseph R. Strobel

Dr. Edwin L. Hunger, Chairman
Executive and Policy Committee
Area Vocational Education Study
Columbia, Dutchess, and Putnam Counties
c/o Poughkeepsie City School District
Poughkeepsie, New York

Dear Dr. Hunger:

In fulfillment of an agreement dated March 19, 1964, between the Executive and Policy Committee of the Area Vocational Education Study for Columbia, Dutchess, and Putnam Counties and the Center for School Services, I am pleased to submit 2000 copies of a report entitled, Education and Employment.

The committees representing Columbia, Dutchess and Putnam Counties deserve commendation for the vision and concern which led them to secure professional guidance for the resolution of problems in the complex area of vocational and technical education. The professional staffs throughout the counties were most cooperative in providing data and facilitating the study in general. The spirit of good will which prevailed throughout the study augurs well for an effective follow through on the recommendations made.

Obviously, all recommendations in the report are not equally applicable or viable. Final decisions, moreover, are always the prerogative of constituted authority. This report will serve its purpose best if it is studied and discussed by all who are concerned with vocational and technical education in Columbia, Dutchess, and Putnam Counties - - legislators, boards of education, administrators, professional staffs, parents, lay leaders, and other citizens. To this end, the Study Director is prepared to assist with the presentation and interpretation of the report.

You may be sure that New York University and its Center for School Services will maintain a continuing interest in educational development in the tri-county area.

Sincerely yours,

Lou Kleinman

SECTION I

VOCATIONAL-TECHNICAL EDUCATION FOR SECONDARY SCHOOL STUDENTS

Education is a process of acquiring the knowledge, skills and standards of a culture, and learning to contribute to that culture. The public elementary and secondary school is but one of the many institutions in the United States engaged in education. The roles of home, church, and community are basic, and educational opportunities are supplied by colleges, universities, professional schools, parochial schools, and schools for continuing adult education. The primary responsibility for education of most Americans rests with the public schools. It is with the quality of these schools that most people are concerned today.

The best education is that which does most to enable each student to develop his abilities and, at the same time, to learn how best to serve the society in which he lives. Education must then be appropriate for serving the needs of each individual and the needs of society. It must be kept in mind that students are individuals, student bodies are constantly renewed, and our society is continually changing. The highest quality education demands never ending adaptation and improvement.

The diverse needs of society demand diversified education. A society which strives to maintain high standards of living and culture needs to develop talents of every type. Communities differ and therefore the schools which serve them must differ. Education of many kinds must be provided in America.

Early Developments in Vocational-Technical Education

The concept of "vocation" is as old as man. People have always had to make certain career choices which have over the years come to be known as a "vocation." Until rather recent times the person's occupation was often determined by birth. Whether the young person became a craftsman, farmer, merchant, or preacher he recognized his vocation as something permanent, or for life.

The son's life work was very often the same as his father's. The son learned the rudiments of that work from his father and from other men in the community. The method of learning occupational skills was largely through observation, imitation, and personal initiative. In larger commercial centers, skills were transmitted in a more organized manner through apprenticeship.

This state of vocational affairs was well suited to a society whose political, cultural, economic, social, and religious institutions were based on permanency. Beginning in the sixteenth century, and slowly gaining momentum in the seventeenth and eighteenth until the acceleration was moving with great force in the nineteenth and twentieth centuries, a counter-trend developed, a trend described as "change". Change, and not permanency, became the mark of many institutions including cultural, religious, social, economic, and political, if these institutions were to survive.

Each of these great changes, and the industrial revolution in particular, wrought great changes involving man and his work. For increasing numbers of men, the pursuit of a vocation involved more than observation, imitation, and initiative; this involved some form of vocational training and eventually the establishment of formal vocational education. In a factory and office system, geared to great change and marked by specialization, the son was not necessarily going to do the same work his father had done. The son needed new training and he needed it from a new place.

Recognition of Vocational Education as a State Function

The years between 1900 and 1910 were ones of great growth in the United States. The population increased from seventy-six million to over ninety-two million. The gross national product more than doubled. Farm income, after two lean decades, rose sharply. Boosts in industrial production ranged from eighty-five to one hundred and sixty percent. Along with the accelerating social and economic changes came new demands from both the factory and the farm for skilled workers and managers. During the early 1900's, the need for skilled manpower became critical and the country turned to its school system for an answer. Educational decisions had to be made during these years and were made, not because of educational consensus but rather societal pressure to get a job done.

In January 1914, Congress authorized and the President signed a bill creating a Commission on National Aid to Vocational Education. The report of the commission finally led to the passing of the Vocational Education Act of 1917 known as the Smith-Hughes Act. The initial Smith-Hughes Act provides an annual grant of $7.2 million dollars to the states: three million dollars for agricultural training, three million dollars for trade-and-industrial and home economics education, one million dollars for teacher training and the rest for Federal costs of administering the act. The $7.2 million yearly appropriation for the Smith-Hughes Act continues today although prior to the passage of the Vocational Education Act of 1963 various other enactments had added some forty million dollars to that basic yearly fund.

Types of Administrative Units for Vocational-Technical Education

The Administrative patterns utilized for vocational education in the various states differ greatly. In Connecticut, programs are planned, administered, and financed directly by the state. These programs are conducted in area vocational schools. States with county administrative organization for all schools often include the administration of vocational education programs under the same boards of education. In most states the vocational education programs are part of the local systems. Combinations of the patterns mentioned above exist in some states. In New Jersey the existence of county vocational education boards separates most vocational education from the rest of the public school system except at the state level. Fifteen of New Jersey's twenty-one counties have County Boards of Vocational Education for area vocational-technical education. For a number of years, there were several county vocational programs in the State of New York.

Vocational education programs are found in comprehensive high schools, in vocational high schools, in technical high schools, and in area vocational schools. All of these schools generally provide training programs for adults as well as high school students.

The comprehensive high school is an organization where all pupils of secondary school age may study those courses for which they are best equipped. In the comprehensive high school, academic, vocational, and technical students are housed under one roof. In communities, where there can be only one high school, the comprehensive high school offers a possible solution to providing both academic and vocational-technical programs. However, the number of students is often too small to provide a wide selection of courses. Theoretically, the comprehensive high school should be feasible and desirable in small cities or large suburban communities. One difficulty with this type of school organization is the tendency to downgrade the vocational-technical programs in favor of the programs for college preparation.

Currently most vocational-technical programs in large urban areas are offered in one or more vocational or technical high schools. It has always been accepted that a larger unit was economically more feasible to administer. Cities such as New York and Buffalo, with large concentrations of pupil population, can administer vocational programs in separate vocational schools with diversified offerings and even with some schools offering programs in highly specialized areas of industry and technology. Smaller communities and school districts have been forced to settle for much less in vocational-education opportunities for their children. Because most vocational education is expensive to provide, most rural schools have been unable to offer any vocational courses at all.

The Area Vocational-Technical Center

Dr. Walter M. Arnold, United States Office of Education's assistant commissioner for vocational and technical education, in 1963 stated, "An area administrative organization has many advantages. Usually it is more flexible and effective than local administration because of its broader administrative and taxing base, the possibility of enrolling more students from a larger geographical area, the wider range of courses it can provide, and the variety of facilities and equipment it can make available to meet specific and immediate training needs of employed workers as well as of students preparing to enter occupations". The area school is a larger administrative unit designed to serve more efficiently an area larger than the traditional local school district. A survey completed by the American Vocational Journal, reveals steady progress and expansion. Nearly one-half million persons are being served today in more than three hundred such schools in operation in thirty-three states and the District of Columbia. The United States Office of Education reports that seventy-one new area vocational-

technical schools were opened during fiscal 1963, thirty-seven more are under construction and sixty-nine are in the planning stage. In addition, fifty-three area schools are planning to expand their offerings in technologies next year and many currently are adding new facilities.

Our New Technology and Unemployed Youth

The public schools of the United States now enroll nearly all of the children of all of the people, an enviable accomplishment achieved during the last century. Parents expect the schools to provide an education for effective citizenship, the development of habits of safe, healthful living, a respect for individual dignity, and the practice of friendly cooperation, as well as an introduction to appreciation and practice of the arts. Parents also expect their children to learn how to make a living, preferably a better living than they have managed to provide.

On a national base, of every ten students now enrolled in elementary grades, three will probably not attain high school graduation. How will these three earn a living without a high school diploma? Of the other seven boys and girls who will finish high school in this decade, three will not go on to college. What will these three high school graduates do for a living? Of the four remaining students who will eventually enter college, only two will receive a baccalaureate degree. Thus, eight out of ten youngsters now in elementary schools most likely have a need for vocational education. These young people will enter the labor force in this decade twenty-six million strong, and will account for nearly ninety percent of the growth in the labor force during the 1960's. Will these young workers be well prepared for the world of work? Will their interests, skills, and knowledge match the changing requirements of the economy?

A recent report made by the American Council on Education indicates that the country is confronted by the paradox of between four and five million persons unemployed, while there are job openings for some four million skilled workers. It places much of the blame on the emphasis and prestige given to "the college track" in the schools, which concentrate attention on about twenty percent of the students - those who complete college. The other eighty percent - those who either drop out of high school, fail to enter college, or drop out of college without a degree - enter the modern technological world "unequipped with the tools they need for survival". The study[1] reported that in order to meet the minimum goals of one hundred thousand new technicians for science and engineering fields alone, the educational system must triple its present efforts. By 1970, the technical, highly-skilled occupations will account for more than half of all job opportunities.

The Vocational Act of 1963

The Vocational Education Act of 1963 was passed because of the accumulating evidence that the old Federal program of assistance to vocational education - the one begun by the Smith-Hughes Act in 1917 and augmented and supplemented over the years by other acts of Congress - was not broad enough, or flexible enough, or rich enough to meet the needs of today, much less the needs of tomorrow.

The act is comprehensive: it excludes no group, no occupation, except those generally considered professional or as requiring a baccalaureate or higher degree. It is concerned about workers of all ages at all levels for all fields; about persons in sparsely-settled areas as well as the urban; about delinquent young people as well as the most industrious; about the employed as well as the unemployed and the underemployed. In its provisions for making vocational training accessible to all persons, the act is not only idealistic but realistic; it requires each state and each community to plan its vocational education programs with an eye always on the changes taking place in the economy and in the world of work.

The Act is also concerned with quality of education - with wise choices by the students, with the training of teachers, with the supply of materials and equipment, with research of problems and a search for solutions. The Act provides for assistance which should help bring excellence into all programs of vocational education.

Summary

A school program of high quality is one in which the promise of educational opportunity for each

---

1. Venn, Grant, Man, Education, and Work. Washington, D.C.: American Council on Education, 1964.

student is made real through the proper guidance and teaching. Secondary schools should offer varied and specialized programs of instruction which make possible a broad general education, advanced and specialized study, and the planning of programs on an individual basis. Educational offerings should be appropriate to meet the needs of individual students with different social needs.

The quality of an educational enterprise is largely determined in each locality. High quality in a local educational system depends directly on the character of the community at large and on the abilities and attitudes of the parents, the school boards, the administrators, and the teaching staff. The basic quality in a school is a vigorous public commitment to education based on understanding of what education can do and what good schools are like.

The first step in providing quality education for all of the youth in the tri-county area is to survey the needs. These needs may well be determined by going to the students, the parents and the potential employers. The needs for quality educational programs in the area have changed just as they have changed in all sections of the United States. Education for the world of work in a changing technological society must provide for better programs and adequate facilities for vocational education. The area needs will be determined by this survey and the recommendations based on the findings will help the citizens of the tri-county area decide what kind of vocational-technical education opportunities they will provide for the youth of the area.

SECTION II

ORGANIZATION OF THE SURVEY

The geographical area covered by this tri-county study is located in southeastern New York State and comprises a major section of the seven-county Mid Hudson Economic Area. The survey area is composed of a series of three counties on the eastern side of the Hudson River and bounded by the New England States on the east.

The area is of a rectangular outline extending approximately one hundred miles in a north-south direction and about twenty-eight miles in an east-west direction. The boundary on the north is Rensselaer County and on the south is Westchester County.

The main line of the New York Central Railroad serves the cities and towns along the Hudson and the Taconic State Parkway almost bisects the counties and serves all areas as the main north-south artery for passenger car transportation. Several other good state highways and five bridges spanning the Hudson make almost every part of this tri-county area readily accessible by automobile. The sparsely populated areas in eastern Columbia and Dutchess Counties and the western part of Putnam County has resulted in the development of small high schools serving large geographical areas.

During the early part of 1964 the Boards of Education and School Administrators of Columbia, Dutchess and Putnam Counties together with the authorities of the Parochial High Schools in this area joined in the effort of conducting a survey to determine the desirability of establishing an area plan for vocational and technical education. The State Education Department, Division of Industrial Education, supported this study as a part of a state-wide plan to provide the highest quality program for occupational, vocational and technical education to all areas of our state.

Executive and Policy Committee

An Executive and Policy Committee composed of eleven school superintendents representing the schools of the area was organized with Dr. Edwin L. Hunger of Poughkeepsie City Schools as chairman. The purpose of this committee was to organize and administer the study and also to establish policy for its conduct. A unanimous decision to engage the services of New York University's Center for Community and Field Services was made early in March. Dr. John G. Miller, Director of Instructional Shops for the Department of Vocational Education at New York University, agreed to act as director of the proposed study which began the first of May.

The study was designed in several phases, each relating to the planning of area programs for occupational, vocational and technical education with an emphasis on secondary education. The main phases of the study design are:

A study of the population in the area including projections for the future.

A detailed survey of the existing enrollment, and programs related to occupational, vocational and technical education in the secondary schools of the survey area.

A detailed survey of the occupational interests of high school students including student's reactions to the establishment of high school programs which would prepare them for entering gainful employment.

A comprehensive study of the viewpoints of the parents of high school students with respect to the vocational choice of their children and also their own reaction to occupational, vocational, and technical education on the secondary level; also parent's interests in possible apprenticeship and occupational extension courses.

The problem of the high school "drop out" was considered as a major factor in anticipated plans and therefore a study of a single class of students who had finished or left high school was conducted.

The employment phase of the study was conducted by contacts with key persons in the fields of agriculture, business, industry, public institutions, labor and employers' organizations. From information gathered, a picture of future employment possibilities led to recommendations related to occupational, vocational and technical education.

The final phase of the study is concerned with a summary of the data gathered by the survey team and recommendations for action with statements of alternatives for the implementation of a vocational-technical program to service the entire tri-county area.

Planning and Action Committee

A committee of sixty-three high school administrators, guidance personnel, and other interested school administrators made up this working committee representing the high schools. This committee assisted in the preparation of questionnaires; administered questionaires to the parents and students and conducted the study of the "Class of 1962". The duties of this committee will extend beyond the completion of the report since they will be a key group representing the schools and commissioned to see that plans are made in the near future to implement the recommendations of the study.

Advisory Committee

A committee of seventy-nine laymen representing industry, business, labor, members of school boards, and others assisted in the employment phase of the study. This committee reviewed the survey outline; aided in development of employer's questionnaires; aided in making contacts with business and industry; and made many valuable suggestions for obtaining facts about employment in the survey area. The Advisory Committee will extend its function beyond the preparation of this report by assisting in the development of public understanding during the period of final implementation of the survey recommendations.

Survey Team

The survey team composed of specialists in the field of vocational education visited existing facilities, served as consultants to the above committees and together with a staff of tabulators, assembled the findings and prepared the final report.

Format of the Study

The various phases of the survey were defined and accepted by the executive committee before work was begun. These phases formed section headings for the final report. At the request of the Executive Committee all of the information was tabulated by County in such a way that it might be separated if found necessary for other uses. Although this sectional reporting is used throughout, each section of the report contains data which concerns the tri-county area as a whole.

LOCATION OF SCHOOL DISTRICTS IN THE TRI-COUNTY AREA

SECTION III

POPULATION DISTRIBUTION

Population by Counties

In planning an area program of vocational-technical education, it is important to know the present population and the projected future changes. The data presented here provides an overall picture of the number of people living in the survey area and the estimated population growth through 1980.

Table 3.1 Population Growth in the Tri-County Area

Year	Columbia	Dutchess	Putnam	Total
1940[2]	41,464	120,542	16,555	178,561
1950[2]	43,182	136.781	20,307	200,270
1960[2]	47,322	176,008	31,722	255,052
1963[1]	48,733	189,137	35,886	273,756

COLUMBIA

DUTCHESS

PUTNAM

Table 3.2 Population Projections [3]

		1970	1980
Columbia	Low	51,360	58,570
	High	57,771	59,716
Dutchess	Low	218,610	279,600
	High	270,180	405,000
Putnam	Low	51,231	90,622
	High	57,647	110,000
Total	Low	321,201	428,792
	High	385,598	574,716

1. Business Fact Book, 1963 Supplement. Albany: Department of Commerce, 1964.
2. Basic Statistics for Columbia, Dutchess, and Putnam Counties. Albany: Department of Commerce, 1964.
3. Projections of Regional Developments. Albany: Office for Regional Developments, 1964, (Mimeo).

Tables 3.1 and 3.2 show that expected increases in population in the 1960's in Columbia County range for a low of 8.5% to a high of 9.4%; in Dutchess County from a low of 24.2% to a high of 53.5% and in Putnam County from a low of 61.5% to a high of 81.6%. During the 1970's continued growth is expected until the percentage of increase in population over the 1960 figures reaches a low of 22.9% to a high of 26.2% for Columbia County; a low of 58.8% to a high of 130% for Dutchess County; and a low of 185% to a high of 247% for Putnam County.

In the next fifteen years, it is quite possible that the combined population of the three counties will reach the half million mark and even more. A conservative estimate indicates a population of more than 400,000.

Population in Towns

In considering population concentration as a possible aid in establishing vocational-technical education centers, a breakdown of population figures by cities and towns is provided.

Table 3.3 Population in Towns 1960[1]

COLUMBIA COUNTY

Angram Town	1080
Austerlitz Town	809
Caanan Town	1272
Chatham Town	3402
Claverack Town	4989
Clermont Town	980
Copake Town	1630
Galatin Town	621
Germantown Town	1504
Ghent Town	3485
Greenport Town	3299
Hillsdale Town	1299
Hudson City	11075
Kinderhook Town	4185
Livingston Town	1770
New Lebanon Town	1674
Stockport Town	2025
Stuyvesant Town	1496
Taghkanic Town	727

The population in Columbia County is spread over the entire county, with the bulk living in and around the City of Hudson.

1. United States Census, Characteristics of Population, 1960, New York.

Table 3.4 Population in Towns[1].

DUTCHESS COUNTY

	1960
Amenia Town	7546
Beacon City	13922
Beekman Town	3326
Clinton Town	1639
Dover Town	8776
East Fishkill Town	4778
Fishkill Town	7083
Hyde Park Town	12681
La Grange Town	6079
Milan Town	944
Northeast Town	2489
Pawling Town	3938
Pine Plains Town	1608
Pleasant Valley Town	4046
Poughkeepsie City	38330
Poughkeepsie Town	32164
Red Hook Town	6023
Rhinebeck Town	4612
Stanford Town	1614
Union Vale Town	1138
Wappinger Town	9577
Washington Town	3695

The bulk of the population in Dutchess County is living in the area along the Hudson River.

Table 3.5 Population in Towns[2].

PUTNAM COUNTY

	1960
Carmel Town	9113
Kent Town	3924
Patterson Town	2853
Philipston Town	5918
Putnam Valley Town	3070
South East Town	6844

The bulk of the population in Putnam County - nearly half - is centered around the Carmel and Brewster area.

SECTION IV

PRESENT PROGRAMS AND FACILITIES

A study of the needs for an area program in vocational-technical education would be incomplete without an overview of the present secondary school programs in existence throughout the survey area. Questions related to the study are:

> What are the present organizational patterns of the schools within the survey area?
>
> What is the enrollment in these grades which might benefit from a vocational-technical program?
>
> What are the projected high school enrollments?
>
> What is the present "holding power" in the high schools?
>
> What kinds of continuing education do high school graduates report and what percent of the graduates continue their formal education?
>
> Are there any adult education courses of a practical nature?
>
> What present programs are now established in vocational-technical education?

Answers to these and additional related questions were obtained by one of two procedures: (1) A questionnaire was designed and sent to each high school principal to obtain much of the statistical data. (2) A member of the survey team made visits to the larger schools in each of the counties. During these school visits, it was possible to interview superintendents, principals, members of the guidance staffs, a coordinator of a department of technical and industrial arts education, industrial arts teachers, and trade teachers. A member of the survey team was able to observe many shop classes in session. session.

The information in this section of the study was developed from the replies to the questionnaire and also from structured observations and interviews made during the visits to seventeen schools and BOCES programs.

Schools and Their Organizational Patterns

A total of thirty-two (32) schools participated in the study. This represents all of the public school districts in the three-county area, together with two parochial schools which have high school enrollments. There were eleven participating schools in Columbia County, fifteen in Dutchess County, and six in Putnam County. The type of district represented by the schools participating in the study is shown in Table 4.1

Table 4.1 Types of Schools Districts

	Central	Union Free	City	Parochial	Common	Total
Columbia	6	2	1	1	1	11
Dutchess	9	4	2	1	1	17
Putnam	5	1	0	0	0	6
Total Tri-County	20	7	3	2	2	34

Of the thirty-two participating schools, two public schools did not have high school classes. The Garrison Union Free School in Putnam County sends all of its high school students to Highland Falls High School in Orange County. These students were not covered in the phase of the study dealing with occupational interests since they could not be contacted as a group. Enrollment figures from Garrison and Putnam Valley Schools are included with this report since these students might take advantage of an area plan for vocational-technical education. The high school students in Claverack, Greenport and Stottville School Districts, all in Columbia County, attend high school in neighboring districts in Columbia County and therefore have been included in this study as members of the high school where they attend. The high school students from Spackenkill and Glenham Union Free Schools, Dutchess County, attend corresponding grades in neighboring school districts and likewise are represented by the figures in the schools they attend. In the area covered by this Survey, there are twenty-six schools with programs leading to a high school diploma.

Enrollment Distribution in Grades 9, 10, and 11 as of June 1964

In order to show the population distribution of high school students which an area vocational-technical program might serve, a tabulation of the enrollment of students in grades 9, 10, and 11 as of June 1964 is presented. These grades were selected since they will represent the school population of the 10th, 11th, and 12th graders in the school year 1964-65. It is for these three grades that secondary programs of vocational and technical education are primarily designed. In large cities where vocational and technical programs have been well established, eighteen percent of the enrollment in grades 10, 11, and 12 avail themselves of this type of specialized education.[1] Table 4.2 shows the distribution of these enrollments with totals for each county. There are centers in each county where the larger enrollments occur. These centers correspond to population concentrations and may indicate possible locations of area centers.

Experience has shown that it is not economically feasible to plan vocational-technical programs for school districts with fewer than one thousand to fourteen hundred students in grades 10, 11, and 12.[2] Table 4.2 shows that there are only two schools in the survey area which have enrollments meeting this minimum requirement. When the total enrollment in these grades in the three-county area of eleven thousand, three hundred and fifty-six is considered, the possibility of combining districts to establish centers for area programs is worthy of consideration.

Projected High School Enrollments in Grades 10, 11, and 12

The majority of schools in the study area reported on projected enrollments through the 1967-68 school year. These projections may be found helpful in determining geographical areas where school populations are likely to increase or decrease. This information should not be treated as an absolute projection of school enrollments since unforeseen factors such as rapid population growth due to increased movement into some areas from nearby urban communities is contemplated in projected population figures published by the United States Census. Information on projected population of the study area is in Section III of this report. Table 4.3 shows projected enrollments for the grades in high school from which an area vocational-technical program might draw. There appears to be a steady rate of anticipated growth in many of the districts. The most rapid growth is anticipated in districts just outside the City of Poughkeepsie.

Estimated "Holding Power" of Secondary Schools

Nationally, the President's Panel of Consultants on Vocational Education recently reported that during the present decade, of every ten youngsters presently enrolled in grade schools, three will not finish high school. This report indicated a potential national "drop-out" rate of thirty percent.[1]

Administrators in each of the schools participating in this study were asked to report on the "holding power" of their respective high schools. Holding power was figured by the pupil accounting method[2] as established by the State Education Department. The percentage of holding power was established for the group of students who were in the ninth grade in 1960-61 and would normally continue their high school education through graduation in 1964. The "holding power" of schools in the area ranges from a high of 93.1% to a low of 67.1%. The over-all holding power of 80.8% for the survey area compares favorably with national figures. Table 4.4 shows the holding power percentages and the number of "drop-outs" from the 1964 graduating class in each of the high schools.

Table 4.4 Holding Power of the High Schools

Continuing Education of High School Graduates

On the national level, it is reported that seventy percent of our elementary school children finish high school. Of those who receive a high school diploma, fifty-nine percent continue their education. This group of students entering educational programs beyond the high school represents forty percent of our country's youth.[1] Some of these high school graduates attend four-year college programs; others attend junior or community colleges; a smaller number attend nursing schools, business schools, special trade schools, and other post-secondary programs.

Schools in the survey area reported on continuing education for a recent graduating class. Percentages of students pursuing education beyond high school range as high as eighty-four percent. Table 4.5 presents a detailed report on education beyond the high school as reported by the schools in the tri-county area. Note the relationship between the figures in the table and national percentages mentioned above.

* Parochial schools

** Four-year high schools only

*** The number of graduates increased by the number of voluntary withdrawals

Adult Education of a Practical Nature

Schools in the survey area were asked to report the number of adult education classes available in their communities which were of a "practical nature". Many course titles indicated a need for self improvement among adult employees. An area vocational-technical center would undoubtedly include an evening adult program for all participating districts. Reports from the schools indicate the following for the school year 1963-64:

Columbia County

Hudson High School reported adult classes in Blueprint Reading, Bookkeeping, Refrigeration and Air Conditioning, Typing and Advanced Tailoring.

Dutchess County

Arlington Central School offered classes in Basic Electricity, Blueprint Reading, Industrial Measurement, and Professional Engineering Refresher I and II.

Beacon High School reported adult classes in Welding and Typing.

Poughkeepsie High School has an extensive adult program including apprentices which is covered in detail elsewhere in this section of the study.

Tivoli had an adult class in Typing.

Ketcham High School in Wappingers Falls, offered adult classes in Typing and Shorthand.

The Young Farmer Program of Vocational Agriculture was conducted in Chatham, Roeliff Jansen, and Webutuck as an adult evening class.

Mention should be made of the evening program in Dutchess Community College. About one thousand, three hundred students took advantage of evening extension courses last year. The majority of these offerings emphasize technical knowledge rather than manual skills. More information on the program of Dutchess Community College, included elsewhere in this section of the study.

Putnam County

Carmel and Mahopac had an adult education program in which Typing and Shorthand were offered.

Terms Related to Vocational Education

Education in secondary schools includes several kinds of vocational and technical programs. Each program has a specific purpose in providing skills required for entering occupations upon completion of high school. In order to have no misunderstanding with respect to the areas of instruction covered by the broad term "Vocational-Technical Education", the following definitions are included here:[1]

Agricultural Education

"Vocational education in agriculture will be designed to meet the needs of persons over fourteen years of age who have entered upon or are preparing to enter: (a) the work of the farm or farm home, or (b) any occupation involving knowledge and skills in agricultural subjects, whether or not such occupation involves work of the farm or of the farm home."

Business and Office Education

"Programs of instruction will be concerned with concepts of the American business system, be committed to a career development approach, with each regular vocational student having a stated career objective..."

---

1. Definitions furnished by the New York State Education Department, 1965.

Agricultural Education

"Vocational education in agriculture will be designed to meet the needs of persons over fourteen years of age who have entered upon or are preparing to enter: (a) the work of the farm or farm home, or (b) any occupation involving knowledge and skills in agricultural subjects, whether or not such occupation involves work of the farm or of the farm home."

Business and Office Education

"Programs of instruction will be concerned with concepts of the American business system, be committed to a career development approach, with each regular vocational student having a stated career objective..."

Distributive Education

"Programs of instruction will be concerned with concepts of the American business system, be committed to a career development approach, with each regular vocational student having a stated career objective..."

Health Occupations

"The health occupations render supportive services to the health professions such as nursing, medical, and dental practice, all of which are concerned with providing diagnostic, therapeutic, preventive, restorative and rehabilitative services to people."

Home Economics

"Homemaking-Vocational education in homemaking means education which provides instruction which will enable families to improve their family life through more effective development and utilization of human resources."

"Vocational education in home economics directed toward gainful employment provides instruction that qualifies individuals to engage in occupations involving knowledges and skills in home economics subject matter areas, i.e., child development, clothing and textiles, food and nutrition, home and institutional management, home furnishings and equipment, etc. Included are such occupations as those which provide services to families in the home and similar services to others in group situations; those which provide assistance to professional home economists and professionals in fields related to home economics in business, agencies and organizations etc.; and other occupations directly related to one or more home economics subject-matter areas."

Industrial Arts

"Indusrial arts as a school subject, is the broad study of the materials, organization, tools, processes, products, jobs and the human problems of industry. It is developed through planning and constructing projects of interest to students, and through discussions, observations and readings related to industry."

Technical Education

"Technical education...will be designed to train persons for employment as highly skilled technicians in recognized occupations requiring scientific knowledge in fields necessary for the national defense."

Trade Education

> "Trade and industrial education means education which includes any subject which is necessary to develop the manipulative skills, technical knowledge, and related information such as job attitudes safety practices and trade judgment necessary for employment in a trade and industrial occupation."

The present program of vocational or technical education in the three-county area includes, with the exception of practical nursing, at least one program in each of the types defined. Table 4.6 shows the distribution of programs by counties and also the enrollments and number of teachers and schools involved.

BOCES and Vocational Education

In the Survey Area, there are four supervisory districts which have a Board of Cooperative Educational Services. BOCES makes possible such educational services, to the smaller schools, that are not normally available because of low enrollments. For a number of years, the BOCES in Putnam County has provided trade education for the eleventh and twelfth grade students in the high schools of that county. Courses in Building Construction and Auto Mechanics are available for boys, and a course in Cosmetology has been established for girls. The students in the BOCES program take the regular general-education classes in their home school in either the morning or afternoon. For their special skill courses, they are transported by bus to the location of the shop facility in Carmel for the boys and the cosmetology facility in Mahopac for the girls. Some students are transported a distance of twenty miles.

In Columbia County, the First Supervisory District has a BOCES. A very successful two-year Auto-Mechanics course is offered in a rented garage in Kinderhook. Students are transported from their home school during half of the school day and spend the balance of the day in regular high school classes at their home school. Agriculture Education is offered as a part of the BOCES program of the First Supervisory District. These classes are conducted in the high school building at Chatham.

Plans are under way for expanding the services of BOCES in both of these counties. "Work-Study" programs are being considered to give high school students a beginning work experience under school supervision.

Although there is a BOCES in the Sole Supervisory District covering Dutchess County, there are no vocational programs in any of the district schools. A possible reason for this situation is the existing vocational program in the City of Poughkeepsie. Recent interest in establishing vocational programs sponsored by this BOCES has not been acted upon pending the outcome of this tri-county survey.

Vocational and Technical Education at Poughkeepsie High School

Poughkeepsie High School is a comprehensive school with a long-established program in vocational and technical education. The vocational-technical program which was started in 1926, is administered by a Coordinator of Technical and Industrial Arts Education. Trade courses in Machine Shop, Auto Mechanics, and Cosmetology are offered. A technical course in Electricity is offered as part of a program outlined in Title VIII of the National Defense Education Act of 1958. Poughkeepsie High School services the students residing in the city school district with a very few exceptions. If there is room in a program for a nonresident, and if the nonresident meets the entrance qualifications, he may be admitted. Several nonresident students are being served in the vocational program at Poughkeepsie High School. The fact that more nonresidents are not being serviced by vocational programs is not unusual; it merely emphasizes the possible need for an area program which will serve several school districts in an area. Table 4.6 gives enrollment details.

Business and Distributive Education

A total of sixteen out of the seventeen high schools in the survey area have a program in business education. Physical space and equipment necessary for teaching courses which may enable high school students to enter employment in this area is not as elaborate and expensive as that which is required for trade-industrial and technical education. Table 4.6 shows that this form of vocational education is available to most high school students who wish to take advantage of the training.

Distributive education in the three counties is not as strong as one might expect. Only two schools, both in Dutchess County, have programs for training students to enter employment in this field.

Agriculture Education

Agriculture education in secondary schools consists of a four-year sequence of courses related to farming and agriculture mechanics. At present, there are but four programs in agriculture in the area covered by the Survey.

The BOCES in District One of Columbia County offers a course in agriculture as a service to the schools in that supervisory district. Roeliff Jansen Central School which is located in the southeastern section of Columbia County has a program. In Dutchess County, there are two central schools offering agriculture. These schools are located in the eastern section of the county.

Agriculture education provides a sequence of four one-year courses. Schools often offer Agriculture I and III in one school year and Agriculture II and IV on alternative years in order to justify the employment of a teacher for the lower enrollments in the program. The agriculture education program does not terminate with other secondary school programs in the summer months. The vocational agriculture teacher uses the summer months to supervise students projects on the farms. Agriculture education is therefore a twelve month program. Table 4.6 shows the enrollment and number of teaching positions in vocational agriculture.

Homemaking Education

Nationally, homemaking is the largest vocational program in the high school. Since homemaking education does not usually prepare students for payroll jobs, at present it can be thought of as vocational only in the broadest sense of the term. Only two high schools offered this program in Columbia County. There are three schools with homemaking programs in Dutchess County and only one in Putnam County. See Table 4.6 for details regarding enrollment and number of teachers.

Manpower Development Training Programs

Although the Manpower Development Training Act of 1962 is not strictly a phase of vocational education, the type of training provided by this Act is training for employment. This Act provides for the training and retraining of those individuals who are unemployed or under-employed. There are two centers in the tri-County area where MDT programs have been established, one in the City of Hudson, another in the City of Poughkeepsie.

Hudson

In July 1964, a class for training practical nurses was organized on a twenty-two week basis with provision for an additional twenty-four weeks of clinical experience in Columbia Memorial Hospital. Twenty-four adults were involved in this program. In September 1964, a course was organized for training in the field of auto mechanics in the City of Hudson. Instruction is carried on in a vacant garage rented by the Board of Education. Fifteen adults are enrolled in this training program, which consists of nine hundred and four instructional hours. A second course will begin in March 1965, with fifteen students enrolled.

Poughkeepsie

An MDT program started in Poughkeepsie in 1962 with courses in auto mechanics, key punch operation, stenography, and general machine operator. Seventeen adults have completed training in auto mechanics, fifty-four in key punch operation, fifteen in general machine operator, and thirteen in stenography. In August 1964, a program was established for licensed practical nurses with an enrollment of forty-eight adult trainees. This program is scheduled to be completed June 30, 1965. A second program in stenography began September 1964 with twenty trainees; a second key punch operator program began November 30, 1964 with fifteen trainees in each of three sections. Placement of trained key punch operators has

been highly successful. Each of the fifty-four who have completed the course have reported successful placement as key punch operators. Additional programs are in the planning stage in auto mechanics, cable makers, general machine operator; and a program in general maintenance awaiting State approval. There is an existing need for persons trained in basic building maintenance to serve the needs of the area hospitals, hotels, motels, and public buildings.

Table 4.6 Vocational and Technical Programs by County

(June 1964)

County	Kind of Vocational Program	Offered by BOCES	Number of Schools	Number of Students	Number of Teachers
Columbia	Agriculture Education	1	1	74	2
	Business Education		4	323	7
	Homemaking Education		1	29	1
	Trade Education	1		26	1
Total Columbia				452	12
Dutchess	Agriculture Education		2	151	2
	Business Education		9	548	21 1/2
	Distributive Education		2	67	2
	Homemaking Education		4	183	3 1/2

	Work Experience	1		28	3/4
Total Putnam County				291	11 3/4
Total Tri-County Area				1,851	57 3/4

Apprenticeship and Occupational Extension Programs

Apprenticeship classes are conducted by the Department of Technical and Industrial Arts Education of Poughkeepsie High School in cooperation with labor organizations in that area. The program enables men to improve their related trade knowledge during evening school while working at a trade during the day. During the spring of the 1963-64 school year there were a total of one hundred and fifty enrolled in nine different trade apprenticeship courses. Table 4.7 shows the courses offered and enrollments.

Table 4.7 Trade Apprenticeship Classes at Poughkeepsie High School

Plumbing	22
Sheet Metal	14
Refrigeration	15
Machine Shop	18
Auto Mechanics	14
TV and Radio	19
Domestic Heating	21
Drafting	14
Welding	13
Total	150

There were no other trade apprenticeship courses in other parts of the survey area. Young tradesmen who lived too far away from the Poughkeepsie program must depend on self unorganized instruction for technical and related skills which might improve their earning power.

Occupational extension courses are also offered at Poughkeepsie in the Department of Technical and Industrial Arts Education. These courses are similar to those offered in the apprenticeship program but are not necessarily for persons already employed in a trade. An adult wishing training or retraining in a skill for the purpose of employment or advancement in employment may enroll in these courses. In some cases, these courses were taught at the same time as adult-education classes. In the spring of the 1963-64 school year there were three occupational extension classes with a total enrollment of thirty-seven. Table 4.8 shows this program.

Table 4.8 Occupational Extension Classes at Poughkeepsie High School

Machine Shop	25
Carpentry	4
Wood Finishing	8
Total	37

Dutchess Community College

A report on present programs in vocational-technical education would not be complete without mention of the Dutchess Community College. This college is one of several locally-sponsored two-year colleges established as part of the State University of New York. The campus is located just outside the city of Poughkeepsie. One of the most impressive building units is a modern technology building which houses the laboratories. These laboratories include:

- Architectural Laboratory
- Mechanical Design Laboratory
- Machine Shop Laboratory
- Testing Laboratory
- Electronics Laboratory
- Physics Laboratory
- Nursery School
- Nursing Laboratory
- Dental Assistant Laboratory
- Retail Management Laboratory
- Business Accounting Laboratory
- Secretarial Laboratory
- Business Machines Laboratory

The program of Dutchess Community College includes fifteen technology areas. About fifty-four percent of the students are enrolled in these technical areas which are terminal programs. The balance of the student body concentrate on a two-year liberal arts program and are working toward the goal of transferring to a four-year degree-granting institution upon completion of their two-year curriculum.

About one thousand, one hundred full-time students were enrolled at Dutchess Community College during the 1963-64 school year. About an equal number of students attended evenings on a part-time basis. There are no dormitories on campus; therefore many students commute to and from college by car. The majority of students come from the tri-county area with others from many areas in New York State and a few from other states and foreign countries. Students attending Dutchess Community College in 1963-64 were graduated from high schools in the counties shown in Table 4.9.

Table 4.9 Location of High Schools from which Dutchess Community College Students Graduated

County	Percentage
Dutchess	59.5%
Columbia	3.9%
Putnam	4.7%
Ulster	11.3%
Westchester	2.4%
Orange	1.9%
Greene	.7%
Other Counties in New York State	12.1%
Other States	2.0%
Other Counties	.7%
General Equivalency Diploma	.8%

Dutchess Community College has a Technical Divsion offering training for technicians in nine different areas. Entering students are generally required to have a good background in high school mathematics and science when pursuing the technical programs. Dutchess Community College does not offer the trade courses generally associated with manipulative skills. There seems to be no conflict with the purposes of Dutchess Community College and those of an area vocational-technical program on the secondary level. The technical programs of Dutchess Community College might serve as a terminal education for some of the more able graduates fron an area vocational-technical school.

Industrial Arts

Almost every high school in the survey area has a program of industrial arts. Although the goals of industrial arts are not the same as those of vocational education, there are some common elements and relationships. The purpose of industrial arts is to provide broad experience with tools and materials as part of general education. Vocational education, on the other hand, concentrates on skill in a single trade or industry. Both use shop equipment. Generally an industrial arts course is taught during a single forty-minute period for a school year while vocational education courses are taught for a three-hour daily session for two or three years of school. One of the purposes of industrial arts is to explore areas of industry, especially in the seventh through ninth grades. Many educators consider this aspect of industrial arts as a pre-vocational phase of an industrial education program.

A member of the survey team observed the larger industrial arts programs in each of the counties. The following are some observations:

Many schools in the survey area have excellent facilities for teaching industrial arts in well equipped shops. It was observed that often industrial arts shops located in the older buildings tended to have

obsolete or worn out equipment which should be replaced. Boards of Education often provide fine capital equipment for the school shops when a school is built but then are reluctant to provide a program for replacement as equipment becomes worn or obsolete. One school had begun a program of replacing obsolete equipment. Where needs exist, an organized equipment replacement program should be supported.

Shop Facilities for BOCES Programs

The facilities available for vocational programs offered by the BOCES in Putnam County consisted of a rented building located at some distance from the BOCES offices. Although an evaluation of the Auto Mechanics and the Building Trades courses by a member of the survey team would rank these two programs high even when compared to well established vocational schools with similar courses, there is room for much improvement in connection with building and equipment. The facility for the Cosmetology class was also rented space which was not of suitable design for educational purposes.

The BOCES Auto Mechanics shop in Kinderhook, Columbia County, also conducted in a rented building not designed for educational purposes. Although there was indication of high quality instruction in this program, equipment and building should meet more than minimum standards.

Summary

All of the thirty public school districts, and also two parochial schools located in the tri-county area, participated in the study. There are twenty-seven high schools in the area with an enrollment of approximately eleven thousand, five hundred and twenty-three in grades ten, eleven, and twelve. Projected enrollments for grades ten through twelve indicate a steady growth in almost every district. The total growth in percentage is projected with an increase of 2.3% for 1965-66; 7.8% for 1966-67 and 13.8% for 1967-68.

The total potential "drop-outs" for a single year is estimated at six hundred and eighty-six for the entire three-county area. This figure represents 19.2% of the students beginning the ninth year. Although this figure compares favorably with national estimates, the "drop-out" poses a major problem for the entire community.

Many high school graduates continue their education in some formal school program. Dutchess Community College plays an important roll serving both those interested in technical education and others who desire a two-year liberal arts college program. Undoubtedly many of those who drop out of high school and also many of those who terminate their education with high school graduation, could benefit by an area program of occupational, vocational or technical education.

An area program for vocational-technical education on the secondary level will concentrate on manual and technical skills for entering occupations. There should be no possible conflict with this secondary program and present technical programs offered at the Dutchess Community College. Technical programs at the Community College could suppliment some of the technical programs of an area vocational-technical center for the more able students who wish to advance their education in technology at the community college or, even later, at an engineering college level.

Very few of the participating school districts offer evening adult education courses. Arlington and Poughkeepsie High Schools are the most active in evening courses which are related to occupations. Poughkeepsie High School is the only center for apprenticeship and occupational extension programs in the tri-county area.

Existing day programs in vocational education in the secondary schools include: four in vocational agriculture; thirteen in business education; two in distributive education and six in homemaking. Trade courses are offered at Poughkeepsie High School and by the BOCES in the First District, Columbia County, and also by the BOCES in Putnam County. There is only one technical course available in secondary schools in the study area. A total of one thousand, eight hundred and fifty-one high school students are now being served in the above areas of vocational education. Trade or technical courses are available to only two hundred and ninety-two high school students. A work-study program in the BOCES in Putnam County serves twenty-eight students.

The prevocational aspect of industrial arts provides a natural foundation for any program for occupational, trade or technical education. Emphasis on an area vocational-technical program should strengthen industrial arts in the local schools. An effort should be made to improve facilities and up-date equipment where needed in present industrial arts programs.

SECTION V

OCCUPATIONAL ASPIRATIONS OF HIGH SCHOOL YOUTH

Each of the tenth and twelfth grade students of the high schools in the survey area participated in this phase of the survey by completing a questionnaire dealing with their occupational interests. The questionnaire was prepared by the survey staff in cooperation with the Executive Committee and also the Planning and Action Committee.

Questionnaires were administered in each of the schools under the supervision of a member of the Planning and Action Committee. A proctor was assigned to each group of students and instructed to review the general aspects of vocational-technical education and the specific purposes of the questionnaire. The students were reminded of the importance of their part in the survey which was to fill in the answers to questions on the Occupational Interest Questionnaires. Students were encouraged to ask questions of the proctor while they were responding to the questionnaire.

The information included in this section of the study is a detailed account of the responses of high school youth with respect to occupational choice.

Percentages indicated in this section have been figured on the total number of responses. In some cases it will be noticed that the total percent does not equal one hundred since some respondents did not answer every question on the questionnaire.

COLUMBIA COUNTY

The high-school students in Columbia County completed a total of 1360 occupational-interest questionnaires. The number of responses per school was:

Chatham	219
Ichabod Crane	234
New Lebanon	102
Ockawamick	116
Germantown	82
Roeliff Jansen	136
Hudson	379
St. Mary's Academy	92
Total	1360

Students' Plans for Completing High School

	Number	%
Yes, I expect to graduate with my class.	1155	85
Yes, but later than my classmates.	36	3
No, I expect to leave high school and not graduate.	11	1
I do not know at this time.	126	9

Students' Present Thoughts for Post-High School:

	Number	%
I have a rather specific future plan for the college and/or work I would like.	672	49
I have a plan, but I am not sure of it.	417	31
I have thought about it, but I do not know what I want to do.	237	17
I have not given it much thought.	32	2

What Students Think Actually Will Happen When They Leave High School:

	Number	%
Go to work full time	169	12
Work part time and continue education part time	45	3
Enter an apprenticeship program	24	2
Attend a four-year college or university	386	28
Attend a two-year college	242	18
Take vocational course work	57	4
Attend a technical institute	25	2
Take course work in a private business school	41	3
Get married and keep house	29	2
Get married and continue working	37	3
Enter the Armed Forces	143	10
I do not know what I will do.	92	7

When Students Decided What to do After Leaving High School:

	Number	%
Before entering seventh grade	109	8
While in grades 7 through 9	352	26
While in grades 10 through 12	687	50
Not yet made a decision	183	13

The Factors Which Influenced Students Most in Deciding What They Wanted to do After Leaving School:

(Students were permitted to check more than one.)

	Number
My high school courses	278
Work experience	213
Influence of others (parents, friends, teachers, etc.)	622
Job opportunities available	199
Economic conditions at home	53
My own abilities, interest, personality, etc.	846
I do not know what factors have influenced my decision	66

(Other) Acceptance to college; Academic record; Armed forces; Baby sitting; Books read; Career sessions; Desire to aid society; Desire for education; Educational and economic conditions abroad; Environment; 4-H club; Good job conditions; Homelife; Hobbies; Hospital volunteer work; Interest in one field; Money; Membership in Civil Air Patrol; Religious affiliation; Regard for future; Sports.

Those Who Helped Students to Decide:

(Students were permitted to check more than one.)

	Number
Family members (parents, brothers, sisters)	837
Relatives	225
Friends	373
Teachers	237
School counselor(s), principal(s)	370
No one helped me.	268

(Other) Beauticians; Counseling program; Guest counselors; Doctor; Employers; 4-H Club; Lawyer; Minister; Navy; Nurse; Officers in Civil Air Patrol; Pamphlets; Reports in school; Television; Employment Office.

Occupational Interests

Students were asked to examine carefully the following list of possible occupational areas and to select a choice for a long-time career. If they planned to go to work upon leaving high school they were asked to indicate the occupational area they thought that they would actually enter. Those planning to go to college were asked to designate the area which they might first enter upon leaving college.

Table 5.1 Occupational Interests of Students

	Long-time Career	First Employment on Leaving High School	First Employment on Leaving College
Agriculture and Agricultural Services, Forestry and Fishing:

Wholesale and Retail Trade:			
Retail trade, including: food stores, automotive dealers, general merchandise stores, eating and dining places, apparel and accessories stores, furniture and appliance dealers, gasoline service stations, lumber, hardware and farm equipment dealers, drug and proprietory stores, door-to-door selling, etc.	33	8	15
Wholesale trade, including: motor vehicles and equipment, groceries, drugs, heating and electrical, dry goods and apparel, farm products and raw materials, hardware, machinery, plumbing, etc.	8	5	5

From the following comprehensive list of occupations, the student was directed to:

a. Select up to three occupations he/she intended to or hoped to enter upon leaving high school, and letter them A, B or C to show his/her first, second and third choice.

b. If he/she was planning to attend college, he/she was asked to select up to three which he/she expected to enter after college graduation and letter them X, Y and Z to show his/her first, second and third choice.

c. He/she was also asked to select up to three which he/she intended to enter by 1970 and number them 1, 2 and 3 to show his/her first, second and third choice.

Table 5.3 Interest in Vocational Education Courses:

The table below indicates the courses of most interest to the individual at present:

Trade and Industrial Education	
Air conditioning	2
Auto mechanics	102
Barber science	15
Beauty culture	85
Bricklaying-stone masonry	9
Building construction	20
Cabinet making	4
Carpentry	31
Commercial art	45
Cooking and baking	24
Drafting-sketching	23
Electricity-electronics	22
Food production	8
Forging	4
Foundry	1
Inspection	4
Interior decoration	39
Jewelry-watchmaking	3
Machine shop	17
Painting-decorating	11
Pattern-making	5
Photography	20
Printing-lithography	3
Radio-television repair	10
Sheet metal work	6
Shoe constructiong repair	0
Tool-die making	4
Upholstering	3
Welding	21
Textile-clothing	7
Woodworking	9
Business and Distributive Education	
Accounting	68
Advertising	19
Business machines	36
Business law	29
Credits and collection	1
Data processing	4
Inventory control	1
Merchandising-selling	24
Office practice, office management, machine transcription	65
Retailing-wholesaling	19

Business and Distributive Education (continued)	
Sales promotion	8
Secretarial practice	118
Shorthand	24
Store management	24
Window display	12
Technologies	
Aeronautical	27
Chemical	20
Communication	16
Construction-civil and building	21
Data processing	10
Drafting & design	30
Electrical	9
Electronics	5
Engineering	4
Estimating	3
Hydraulics	7
Instrumentation	1
Industrial & Prod.	3
Mechanical	5
Metallurgical	6
Textile-garment	8
Homemaking	
Growth and development of family: child care, family relationships	39
Clothing and textiles: fabric selection, construction tailoring-millinery	9
Foods and nutrition: diets, food preparation-conservation, table service	23
Health, safety & home care: nursing, first aid, personal hygiene	30
Family resources: personal finance, household mechanics, consumer buying	8
Home improvement: cleaning, laundering, selection of home furnishings	13
Agriculture, Forestry, Fishing	
Soil use and management	22
Crop production	12
Animal & poultry production	22
Agricultural mechanics	12
Farm management-agricultural economics	16
Nursery-florist operation	9
Landscaping-grounds keeping	11
Agricultural occupation other than farming: farm operation and management, finance, record keeping, leadership, farm business management	10
Public Service Education	
Police training	42
Firemanship training	7
Custodial training	2
Power plant operation	5
Water plant operation	1
Sanitary facilities operation	1
Health Services Education	
Practical nursing	51
Nurse's aide	15
Medical record librarians	4
Medical technicians	14

Table 5.3 (continued)

Health Services Education (continued)	
Institutional housekeeping	0
Dental technicians	8
Dietary assistants	3

DUTCHESS COUNTY

The high-school students in Dutchess County completed a total of 3747 occupational-interest questionnaires. The number of responses per school was:

Arlington	456
Beacon	345
Dover	82
Millbrook	131
Our Lady of Lourdes	275
Pawling	113
Pine Plains	139
Poughkeepsie	743
Red Hook	147
Rhinebeck	123
Hyde Park	425
Tivoli	24
Wappingers	673
Webutuck	71
Total	3747

Students' Plans for Completing High School

	Number	%
Yes, I expect to graduate with my class.	3616	86
Yes, but later than my classmates.	3216	3
No, I expect to leave high school and not graduate.	21	0.5
I do not know at this time.	317	8

Students' Present Thoughts for Post High-School

	Number	%
I have a rather specific future plan for the college and/or work I would like.	2101	56
I have a plan, but I am not sure of it.	969	26
I have thought about it, but I do not know what I want to do.	571	15
I have not given it much thought.	72	2

What Students Think Actually Will Happen When They Leave High School

	Number	%
Go to work full time	498	13
Work part time and continue education part time	199	5
Enter an apprenticeship program	46	1
Attend a four-year college or university	1229	33
Attend a two-year college	672	18

(continued)

	Number	%
Take vocational course work	135	4
Attend a technical institute	70	2
Take course work in a private business school	127	3
Get married and keep house	50	1
Get married and continue working	104	3
Enter the armed forces	298	8
I do not know what I will do.	211	6
Enter nursing school	81	2

When Students Decided What to do After Leaving High School:

	Number	%
Before entering seventh grade	312	8
While in grades 7 - 9	997	26
While in grades 10 - 12	1963	52
Not yet made a decision	474	14

The Factors Which Influenced Students Most in Deciding What They Wanted to do After Leaving School:

(Students were permitted to check more than one.)

	Number
My high school courses	1025
Work experience	601
Influence of others (parents, friends, teachers, etc.)	1692
Job opportunities available	659
Economic conditions at home	173
My own abilities, interest, personality, etc.	2245
I do not know what factors have influenced my devision.	192

(Other) Armed forces - 7; Being a patient - 1; Civil Air Patrol - 2; College education needed to get job - 6: Community needs - 7; Desire for high wages - 14; Desire for higher education - 3; Hobbies - 6; Reading - 14; State employment agency

Whose Who Helped Students to Decide:

(Students were permitted to check more than one.)

	Number
Family members (parents, brothers, sisters)	2249
Relatives	697
Friends	972
Teachers	687
School counselor(s), principal(s)	982
No one helped me.	1030

(Other) Air Force and Navy personnel - 10; Clergymen - 15; College representative - 1; Dentist - 3; Doctor - 14; Employers - 12; Employment offices - 3; Private school representative - 1; State policeman - 1

Occupational Interests

Students were asked to examine carefully the following list of possible occupational areas and to select a choice for a long-time career. If they planned to go to work upon leaving high school they were asked to indicate the occupational area they thought that they would actually enter. Those planning to go to college were asked to designate the area which they might first enter upon leaving college.

Table 5.4 Occupational Interests of Students

	Long-time Career	First Employment on Leaving High School	First Employment on Leaving College
Agriculture and Agricultural Services, Forestry and Fishing:			
Farming, including dairy, fruit, livestock, poultry, truck gardening	54	40	17
Fishing, including hatchery operation	28	11	12
Florist, greenhouse, nursery	21	18	11
Forestry, tree surgery	28	17	21
Kennelman	8	7	4
Landscaping, gardening	26	14	9
Farm machinery; sales and service	13	12	7
Feed and fertilizer sales	4	2	0
Garden and lawn sales	6	4	0
Food products inspection	12	2	3
Conservation service	61	29	25
(Other) Printing, fur farming, 4-H agent	1	0	2
Building and Construction:			
Building, including plumbing, painting, electrical, masonry, carpentry, etc.	126	97	47
Highway and street	32	21	19
(Other) Carpenter, heavy equipment operator, truck driver, draftsman	11	7	1
Finance, Insurance and Real Estate:			
Banking	40	26	12
Credit institutions, including savings & Loans, Personal Finance	12	6	7
Insurance carriers, including life, accident, fire, etc.	15	6	13
Real estate, including sales, builders, developers, etc.	21	17	14
Security dealers and exchanges	9	6	6
Government:			
Armed forces (army, air force, marine, navy, etc.)	141	284	159
Federal, including Department of Defense, post office, etc.	38	22	24
State	23	13	7
Local	10	8	6
(Other) Peace Corps	4	8	23
Interpreter	7	1	5
Librarian	3	0	3
Oceanographer	2	0	3

(continued)

Table 5.4 (continued)

Manufacturing-durables:			
Electrical machinery, material and supplies	22	16	14
Fabricated metal products, e.g. cans, cutlery, wire, etc.	1	1	1
Furniture and fixtures	2	4	3
Instruments, including optics, photographic, dental, surgical, etc.	5	2	3
Iron and steel, copper, lead, zinc products	0	2	1
Lumber and wood products	10	8	5
Machinery, including engines, machine tools, office machines, electrical and electronic products, etc.	50	31	22
Ordnance (explosives)	6	5	1
Primary metals manufacture	1	2	0
Stone, clay and glass products	7	3	0
Steel making (and non-ferrous metals)	2	2	1
Transportation equipment	12	8	8
Cement manufacture	0	6	2
(Other) Assembly work, inspector	5	6	4
Manufacturing-non-durables:			
Apparel, men's and boys', women's and misses', furs, leather and leather products, etc.	12	10	12
Chemicals and allied products, including drugs, paints, soap, etc.	7	3	2
Food and allied products, including meat, dairy, canned, grains, beverages, etc.	11	4	4
Paper and allied products, including boxes, bags, tubes, drums, etc.	2	1	1
Petroleum refining, including rubber tires, leather, footwear, etc.	3	3	2
Printing, publishing and allied industries, including bookbinding, cards	16	14	9
Rubber and plastic products	2	5	2
Mining:			
Coal, anthracite	1	0	4
Coal, bituminous	1	0	2
Petroleum and gas	9	4	1
Metal	4	2	5
Quarrying (sand and gravel)	9	9	8
(Other) Minerologist, mining, geology	2	0	3
Professions:			
Accountant, auditor	71	50	58
Architect	79	27	54
Clergyman, priest, minister, rabbi, psychologist, economist, social worker, physicist, chemist, astronomer, biologist	189	68	159
Lawyer, judge, engineer	149	46	140
Mathematician, statistician	55	12	61
Physician, surgeon, dentist, pharmacist, veterinarian	105	23	85
Registered nurse	196	94	149
(Other) Teacher	231	130	333
Services:			
Amusement and recreation, except motion pictures: bowling, golf, skiing and other winter-summer sports	101	50	46
Automotive, including repair, rentals, parking, etc.	81	78	34

(continued)

Table 5.4 (continued)

Services (continued)			
Business, including credits and collections, secretarial (typing, shorthand, filing), data-processing, duplicating, selling, clerking, etc.	360	359	217
Electrical repair, including appliances, heating, radio-television	37	15	20
Hotels, motels, tourist courts, restaurants	37	14	17
Medical and health, including hospitals, offices and laboratories	101	91	100
Motion pictures, including filming, distributing, showing	33	13	8
Personal, including laundry, photography, beauty and barbershop, tailoring, cleaning and dyeing, etc.	131	114	39
(Other) Telephone operator	3	9	1
Modeling	9	4	3
Transportation-Utilities:			
Air	57	47	34
Communication	19	9	17
Electric, gas, and sanitary services	5	3	2
Motor freight	6	4	2
Pipeline	3	1	2
Railroad	3	4	2
Waterway	9	4	4
Wholesale and Retail Trade:			
Retail trade, including food stores, automotive dealers, general merchandise stores, eating and dining places, apparel and accessories stores, furniture and appliance dealers, gasoline service stations, lumber, hardware and farm equipment dealers, drug and proprietory stores, door-to-door selling, etc.	68	84	47
Wholesale trade, including motor vehicles and equipment, groceries, drugs, heating and electrical, dry goods and apparel, farm products and raw materials, hardware, machinery, plumbing, etc.	23	19	12

From the following comprehensive list of occupations, the student was directed to:

a. Select up to three occupations which he/she intended to or hoped to enter upon leaving high school and letter them A, B and C to show his/her first, second and third choice.

b. If he/she was planning to attend college, he/she was asked to select up to three which he/she expected to enter after college graduation and letter them X, Y and Z to show his/her first, second and third choice.

c. He/she was also asked to select up to three which he/she intended to enter by 1970 and number them 1, 2 and 3 to show his/her first, second and third choice.

Table 5.5 A Comprehensive List of Occupations

Institutional housekeeping	8
Dental technicians	48
Dietary assistants	25
Subject of interest which may have been ommitted from above listing	
Conservation	6
Insurance	3
Modeling	12
Music	4
Plumbing and heating	3
Real estate	1

PUTNAM COUNTY

The high-school students in Putnam County completed a total of 651 occupational-interest questionnaires. The number of responses per school was:

Brewster	186
Carmel	200
Haldane	78
Mahopac	187
Total	651

Students' Plans for Completing High School

	Number	%
Yes, I expect to graduate with my class.	562	86
Yes, I expect to graduate, but later than my classmates.	14	2
No, I expect to leave high school and not graduate.	6	1
I do not know at this time.	36	6

(continued)

Students' Present Thoughts for Post-High School

	Number	%
I have a rather specific future plan for the college and/or work I would like.	354	54
I have a plan, but I am not sure of it.	166	26
I have a thought about it, but I do not know what I want to do.	57	9
I have not given it much thought.	20	3

What Students Think Actually Will Happen When They Leave High School

	Number	%
Go to work full time	81	12
Work part time and continue education part time	26	4
Enter an apprenticeship program	14	2
Attend a four-year college or university	190	29
Attend a two-year college	85	13
Take vocational course work	28	4
Attend a technical institute	19	3
Take course work in a private business school	38	6
Get married and keep house	9	1
Get married and continue working	8	1
Enter the armed forces	67	10
I do not know what I will do.	35	5
(Other) Most mentioned jobs or vocations which appear later in the questionnaire.		

When Students Decided What to do After Leaving High School

	Number	%
Before entering seventh grade	53	8
While in grades 7 - 9	144	22
While in grades 10 - 12	227	35
Not yet made a decision	74	11

The Factors Which Influenced Students Most in Deciding What They Wanted to do After Leaving School

(Students were permitted to check more than one)

	Number
My high school courses	188
Work experience	147
Influence of others (parents, friends, teachers, etc.)	271
Job opportunities available	100
Economic conditions at home	27
My own abilities, interest, personality, etc.	337
I do not know what factors have influenced my decision.	39
(Other) Social worker; Travel; Regents scholarships; Having no family	

(continued)

Table 5.6 (continued)

Those Who Helped Students to Decide

(Students permitted to check more than one)

	Number
Family members (parents, brothers, sisters)	361
Relatives	90
Friends	159
Teachers	153
School counselor(s), principal(s)	216
No one helped me.	140

(Other) Present employer; Representatives from different business schools; Minister; Director of admissions at college; Nurses; President Kennedy; Recruiter; Police; BOCES testing center.

Occupational Interests

Students were asked to examine carefully the following list of possible occupational areas and to select a choice for a long-time career. If they planned to go to work upon leaving high school they were asked to indicate the occupational area they thought that they would actually enter. Those planning to go to college were asked to designate the area which they might first enter upon leaving college.

Table 5.7 Occupational Interests of Students

	Long-time Career	First Employment on Leaving High School	First Employment on Leaving College
Agriculture and Agricultural Services, Forestry and Fishing:			
Farming, including dairy, fruit, livestock, poultry, truck gardening, etc.	4	1	2
Fishing, including hatchery operation	4	1	1
Florist, greenhouse, nursery	3	2	1
Forestry, tree surgery	4	0	1
Kennelman	1	2	0
Landscaping, gardening.	0	2	2
Farm machinery; sales and service	1	1	0
Feed and fertilizer sales	1	1	0
Garden and lawn sales	0	2	0
Food products inspection	3	4	1
Conservation service	7	2	5
(Other) Government hunter; game warden; artist; riding instructor	12	4	6

(continued)

Table 5.7 (continued)

Building and Construction:			
Building, including plumbing, painting, electrical, masonry, carpentry, etc.	15	15	9
Highway and street	2	6	2
(Other) Driving heavy equipment; cabinet making; cartographer	7	2	1
Finance, Insurance and Real Estate:			
Banking	9	5	2
Credit institutions, including savings & loans, personal finance	4	2	0
Insurance carriers, including life, accident, fire, etc.	2	2	1
Real estate, including sales, builders, developers, etc.	4	4	1
Security dealers and exchanges	1	2	2
(Other) Self employment, insurance salesman	2	2	2
Government:			
Armed forces (army, air force, marine, navy, etc.)	30	74	44
Federal, including Department of Defense, post office, etc.	7	3	2
State	6	3	4
Local	2	2	2
(Other) Policeman; translator; congressman; foreign service - 2; Peace Corps	7	2	3
Manufacturing-durables:			
Electrical machinery, material and supplies	1	2	0
Fabricated metal products, e.g. cans, cutlery, wires, etc.	0	0	0
Furniture and fixtures	0	1	0
Instruments, including optics, photographic, dental, surgical, etc.	1	0	0
Iron and steel, copper, lead, zinc products	0	0	0
Lumber and wood products	0	3	1
Machinery, including engines, machine tools, office machines, electrical and electronic products, etc.	4	2	4
Ordnance (explosives)	3	3	1
Primary metals manufacture	0	3	0
Stone, clay and glass products	2	0	0
Steel making (and non-ferrous metals)	0	0	0
Transportation equipment	3	1	1
Cement manufacture	0	0	1
Manufacturing-non-durables			
Apparel, men's and boys', women's and misses', furs, leather and leather products, etc.	1	2	1
Chemicals and allied products, including drugs, paints, soap, etc.	2	2	1
Food and allied products, including meat, dairy, canned, grains, beverages, etc.	0	2	0
Paper and allied products, including boxes, bags, tubes, drums, etc.	0	0	0
Petroleum refining, including rubber tires, leather, footwear, etc.	1	2	0
Printing, publishing and allied industries, including bookbinding, cards	0	3	0
Rubber and plastic products	0	3	0
Mining:			
Coal, anthracite	2	1	0
Coal, bituminous	0	2	1
Petroleum and gas	0	1	0
Metal	0	3	0
Quarrying (sand and gravel)	2	1	1
Professions:			
Accountant, auditor	13	5	14
Architect	18	4	15

(continued)

Table 5.7 (continued)

Professions: (continued)			
Clergyman, priest, minister, rabbi, psychologist, economist, social worker, physicist, chemist, astronomer, biologist	24	3	22
Lawyer, judge, engineer	25	3	22
Mathematician, statistician	13	0	9
Physician, surgeon, dentist, pharmacist, veterinarian	16	3	9
Registered nurse	32	13	30
(Other) Teacher	53	10	62
Services:			
Amusement and recreation, except motion pictures: bowling, golf, skiing and other winter-summer sports	12	12	10
Automotive, including repair, rentals, parking, etc.	19	13	3
Business, including credits and collections, secretarial (typing, shorthand, filing), data-processing, duplicating, selling, clerking, etc.	46	44	34
Electrical repair, including appliances, heating, radio-television	7	3	10
Hotels, motels, tourist courts, restaurants	4	7	3
Medical and health, including hospitals, offices and laboratories	6	8	12
Motion pictures, including filming, distributing, showing personal, including laundry, photography, beauty and barbershop, tailoring, cleaning and dyeing, etc.	18	19	2
(Other) Voice; opera singer; zoologist; actress; Peace Corps; entertainer	8	4	5
Transportation-Utilities:			
Air	11	5	5
Communication	6	2	3
Electric, gas, and sanitary services	0	2	2
Motor freight	0	2	1
Pipeline	0	3	0
Railroad	0	2	0
Waterway	0	1	0
(Other) Construction, mechanical engineering	2	1	0
Wholesale and Retail Trade:			
Retail trade, including: food stores, automotive dealers, general merchandise stores, eating and dining places, apparel and accessories stores, furniture and appliance dealers, gasoline service stations, lumber, hardware and farm equipment dealers, drug and proprietory stores, door-to-door selling, etc.	9	13	7
Wholesale trade, including: motor vehicles and equipment, groceries, drugs, heating and electrical, dry goods and apparel, farm products and raw materials, hardware, machinery, plumbing, etc.	4	4	4
(Other) buyer; policeman; modeling; baking; state trooper	5	4	6

From the following comprehensive list of occupations, the student was directed to:

a. Select up to three occupations which he/she intended to or hoped to enter upon leaving high school, and letter them A, B or C to show his/her first, second and third choice.

b. If he/she was planning to attend college, he/she was asked to select up to three which he/she expected to enter after college graduation and letter them X, Y and Z to show his/her first, second and third choice.

c. He/she was also asked to select up to three which he/she intended to enter by 1970 and number them 1, 2 and 3 to show his/her first, second and third choice.

Table 5.8 A Comprehensive List of Occupations

	Hope to Enter on Leaving High School			Expect to Enter on Completion of College			Goal for Employment in 1970

Table 5.9 (continued)

Homemaking	
Growth and development of family: child care, family relationships	34
Clothing and textiles: fabric selection, construction tailoring-millinery	10
Foods and nutrition: diets, food preparation-conservation, table service	12
Health, safety and home care: nursing, first aid, personal hygiene	17
Family resources: personal finance, household mechanics, consumer buying	4
Home improvement: cleaning, laundering, selection of home furnishings	8
Agriculture, Forestry, Fishing	
Soil use and management	12
Crop production	2
Animal and poultry production	11
Agricultural mechanics	1
Farm management-agricultural economics	3
Nursery-florist operation	4
Landscaping-grounds keeping	9
Agricultural occupation other than farming: Farm operation and management, finance, record keeping, leadership, farm business management	3
Public Service Education	
Police training	26
Firemanship training	5
Custodial training	2
Power plant operation	3
Water plant operation	2
Sanitary facilities operation	4
Health Services Education	
Practical nursing	38
Nurse's aide	13
Medical record librarians	4
Medical technicians	18
Institutional housekeeping	1
Dental technicians	2
Dietary assistants	4
Subjects of interest which may have been omitted from the above listing	
With the exception of the following the courses mentioned were not vocational courses.	
Heating and ventilating	1
State trooper	1
Secret services for the U.S.	1
Air Force	1
Navigation	1
Construction	2
Aviation	2
Stage hand	1

Summary

Twenty-four public high schools and two parochial high schools located in the tri-county area participated in this part of the study. Five thousand, seven hundred and fifty-eight questionnaires were returned from students in grades ten and twelve.

Eighty-five percent stated that they expect to graduate with their class and another three percent said they expect to graduate later. Students' present thoughts for post-high school included fifty-four percent who have a rather specific future plan for the college or work they would like.

What these students think will acutally happen when they leave high school is indicated: twelve percent expect to go to work full time; four percent expect to work part time and continue education part time; thirty percent expect to attend a four-year college or university; and sixteen percent expect to attend a two-year college.

About half of the students decided what they would do upon leaving high school while they were in the tenth through twelfth grade span.

The leading factors which influence students in deciding their future plans were: the influence of parents, friends and teachers; and their own abilities, interest, and personality. The leading groups who helped them decide were: family members; and school counselors and principals.

From a comprehensive list of occupations, the student was directed to: Select up to three occupations he intended to or hoped to enter upon leaving high school. The "first choices" were in the following areas ranked in order of number of students interested:

Business-Office Occupations	(338)
Government	(290)
Personal Services	(218)
Professional	(192)
Building Construction	(158)

If he planned to attend college, the student was asked to select up to three which he expected to enter after college graduation. The highest five first choices were:

Professional	1512
Business-Office Occupations	474
Government	180
Amusement-Entertainment	152
Health Services	140

Students were also asked to select first, second, and third choices of the occupation which they intended to enter by 1970. The five areas most-often mentioned were:

Professional	921
Business-Office Occupations	355
Government	203
Amusement-Entertainment	154
Personal Services	132

Ranked in order of student interest, the ten most-frequently mentioned industrial courses are listed below:

Columbia County		Dutchess County	
Auto Mechanics	102	Beauty Culture	246
Beauty Culture	85	Commercial Art 14	142
Commercial Art	45	Interior Decoration	110
Interior Decoration	39	Auto Mechanics	108
Cooking-Baking	24	Electronics-Electricity	84
Drafting-Sketching	23	Drafting-Sketching	80
Electricity-Electronics	22	Machine Shop	72
Welding	21	Cooking-Baking	59
Photography	20	Building Construction	56
Building Construction	20	Photography	51

Putnam County

Auto Mechanics	42
Beauty Culture	41
Electricity-Electronics	22
Cooking-Baking	20
Building Construction	19
Photography	17
Drafting-Sketching	16
Carpentry	15
Machine Shop	15
Commercial Art	13
Interior Decoration	13

From the point of view of student interest, the five most-frequently mentioned technologies are as follows:

Columbia County		Dutchess County		Putnam County	
Drafting-Design	30	Engineering	182	Engineering	49
Aeronautical	27	Drafting-Design	122	Drafting-Design	27
Construcation-Building	21	Electronics	109	Electronics	25
Chemical	20	Aeronautical	85	Aeronautical	18
Communication	16	Chemical	84	Chemical	18

SECTION VI

VIEWPOINTS OF PARENTS OF HIGH SCHOOL YOUTH

The parents of each of the tenth and twelfth-grade students in the high schools of the Survey Area were asked to participate in the survey by filling out a Parent's Questionnaire. After the student had completed the information on the Student's Questionnaire at school, he was asked to take home a "Parent's Guide" and a questionnaire addressed to the parent. The student was asked to discuss the choice he had made for possible occupation with his parent and to help the parent in completing the information requested in the parent's questionnaire. This section of the study deals with the findings resulting from answers to the questions asked of the parents.

Percentages indicated in this section have been figured on the basis of the total number of responses. In some cases it will be noticed that total percent does not equal one hundred since some respondents did not answer every question on the questionnaire.

COLUMBIA COUNTY

There were 915 questionnaires returned to the survey team from parents in Columbia County. The number of responses for each school is as follows:

Chatham	133
Germantown	54
Hudson	257
Ichabod Crane	175
New Lebanon	61
Ockawamick	103
Roeliff Jansen	63
St. Mary's	69
Total	915

Parents Views of Students' Plans

"Do you approve of the choice of vocation or occupation made by your son/daughter?"

	Number	%
Yes	805	88
No.	21	2
Undecided	77	8

Those parents who answered "No" or "Undecided" suggested the following vocations or occupations for their sons/daughters:

Agriculture, forestry and fishing, farming, farm services, etc.	5
Amusement-Entertainment (actor, announcer, sports, etc.)	1
Building construction (plumbing, carpentry, painting, etc.)	4
Business office (bookkeeper, secretarial, clerical, etc.)	11
Distributive (buyer, sales, advertising, shipping, etc.)	2
Equipment repair (auto)	2
Health services (hospital-aides, dental tech., etc.)	1
Home-making (housewife)	1
Insurance (underwriting, claims, adjusting)	2
Personal services (barber, beautician, laundry, tailor, hotels, etc.)	1
Printing and graphic arts (pressmen, commercial artists, etc.)	1
Public utilities (phone, gas, electric, etc.)	2
Technician (draftsmen, lab., engineering, electronic, etc.)	4
Professional (doctor, lawyer, teacher, engineer, etc.)	6
Other	13

"Other" included the following: Interior Decoration - 2; Farm; Related - 1; Dress Designer - 1; Journalism - (free lance writing) - 1; Nurse - 1; Airline Hostess - 1; State Trooper - 1; Social Anthropologist - 1; Hotel Management - 1; Therapist - 2; Geologist - 1

"Do you approve of the vocation or technical courses your child is taking or wants to take?"

	Number	%
Yes	793	87
No	23	3
Undecided	50	5

Those parents who answered "No" or "Undecided" made the following comments: (Many gave no explanation.)

"My son is graduating in June and is really not equipped to any particular vocation."

"Because it offers little or nothing for the future."

"I would like her to take typing and if possible shorthand."

"Not extensive enough in his desired field."

"Because of being set back on regents courses is unable to fulfill adequate desired course."

"We feel he would have more future security in some other field."

"Can't get a job."

"Not related to student or requirments."

"They are not comprehensive enough. They do not give him enough knowledge of the subject."

"Do you favor expanding programs in vocational and technical education for high school students?"

	Number	%
Yes	843	92
No	14	2
Undecided	48	5

"Do you favor expanding program in vocational and technical education for adults?"

	Number	%
Yes	751	82
No	27	3
Undecided	110	12

The parents selected as most-nearly describing their occupations the following:

Occupation	Father	Mother
Professional or technical	166	106
Farmer or farm manager	59	2
Manager, official, or proprietor	128	22
Clerical	23	97
Sales worker	36	15
Craftsman or foreman	170	27
Semi-skilled operator	101	48
Private house worker	3	18
Service worker	83	49
Farm laborer or farm foreman	12	0
Homemaker (housewife)	0	468
Other (Checked only)	7	8

The following table indicated the highest grade completed by the parents who returned questionnaires. The number under the grade number indicates the number of parents in the county who report having completed that grade.

	Elementary								High School				College or Technical Institute							
Year	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
Father	1		1		2	17	13	130	41	71	55	277	31	44	16	51	21	15	19	2
Mother				3	3	2	7	80	44	77	49	366	55	37	26	64	22	4	5	

Parents indicated specialized training in the following fields:

	Father	Mother
Registered Nursing	6	57
Business School	30	93
Apprentice	37	4
Trade (not apprentice)	62	8
Armed Forces (technical)	157	12
Other	88	56

Under "Other specialized training" the fathers and mothers reported a wide variety of training with relatively few in the same field.

The 915 parents who returned questionnaires expect their children will complete grades in school as indicated by the following table. The second line indicates the total for each grade.

	High School				College				Other			
Grade	9	10	11	12	13	14	15	16	1	2	3	4
	1	2		265	19	138	15	359	33	32	28	25

In the "Other" category the parents included the following: Business School - 19; Beautician School - 8; Military - 1; Nursing - 29; Police School - 1; Professional - 19; Technical School - 4; Trade School - 8

The following are some typical suggestions made by the parents in Columbia County regarding vocational-technical education programs:

"I would suggest vocational-technical education programs be set up for 'drop-outs'."

"Cooperative services have proven what can be accomplished. Believe a full curriculum of vocational-technical education is a must in the very near future. People trained for a specific trade are certainly an asset to our society rather than a liability as many now are."

"I think there is a definite need for vocational-technical education now and that the need will get greater in the year to come."

"I would like to see more vocational opportunities for girls such as beauticians and key punch operators."

"We are very much of the opinion that a start must be made to provide vocational training. This is essential for the welfare of our community."

"Whatever the training, let's try to have the students and the teachers cultivate the use of good English at all times---oral and written."

"I took straight academic in high school preparing for college. I appreciate all I learned and use most subject matter often but left high school untrained for future employments. More actual training is needed. I want my children to have the good background of academic training plus the actual training for future employment. My husband received only vocational training and then spent most of his adult life studying academic subjects as he felt he was denied the beauty of a well rounded academic course."

"Vocational-technical education programs should not be confined to the high school students. In the next ten years the retraining or upgrading of currently employed workers will be one of the problems that the area will face. Effective night courses in a vocational school will be one means of effecting this."

"We feel a vocational school would hold the interest of learning to many of the young people who are now 'drop-outs' in high school. We're very much in favor of vocational training."

"The sooner we have a program of this type the better it will be for all."

"More capable students should be trained in the areas most needed, not in the fields where unemployment is high."

"I would like my child to be a hair dresser. It would be nice if you had this on your program."

"Believe their should be more of it---geared to the present---and foreseeable needs of industry. Would like to see a combination of basic schooling (English, arithmetic, citizenship and how to fill out income tax blanks) plus on-the-job or apprentice-type training."

"Would suggest that stenographic course of stenography and typing be extended to four years instead of two now in force."

"Evening classes for students who can't fit the subjects they like into the programs and also night classes for adults."

"More time should be used in providing a well rounded general education, rather than specialization at so young an age. Versatility rather than antiquated training courses in methods that will be old by the time the child leaves school."

"The counties named should expand in the fields of technical educational vocational training for students after high school and should provide training for the non-academic students in the field of vocational training. Specialized training is highly important in the world of today."

"A vocational high school would be especially beneficial in this area. Children of Columbia should be given the ability to further their education. A trade school at high school level would greatly reduce drop-outs of teen-agers."

"Courses to include: auto mechanics, carpentry, and any skills needed to equip high school students who can not because of limited ability go on to higher education to become capable of self support."

"It would be nice if they were less expensive and were closer to those who would like to use them, distance, means a great problem."

"To many surveys and not enough action!"

"We have no specific suggestions-but for some time we have felt that this community needed a vocational school. We were glad to see in our local newspaper that this was being considered. A vocational school would probably interest a lot of students who might decide to drop-out of a regular high school."

"I feel that it would be a most useful program both to the people of the three counties and also to the counties themselves. It is a wonderful idea and I hope it will be carried out."

"Having these programs available only at 50 miles away (Albany) 50 miles away (Poughkeepsie) does not do what is supposed to do for those students who are so inclined but find the distance a barrier-a closer set-up would help.
Something of a stricter vocational nature than that of community college would seem needed in this immediate area."

"If there could be separate technical schools, rather than courses in high school, it would be advantageous."

"If training courses such as the following (or some other course you wish to add) were offered in an evening school in this area, would you be interested in enrolling in one of these programs?"

In answer to this question 276 fathers and 404 mothers expressed interest in enrolling in one of the programs listed below. These 680 parents represent 74% of those returning questionnaires.

Parent's Interest in Occupation Extension Courses

	Father	Mother
Agricultural Machinery Technology	9	0
Agricultural Sales and Service	7	1
Auto Mechanics	13	1
Auto Body Repair and Service	16	1

Some of the "Other" courses listed were: Father: Algebra - 1; Architectural Drawing - 1; Banking - 2; Business Management - 1; Constructural Engineering - 1; Higher Education - 1; Machinist - 2; Masonry - 1; Music Technology - 1; Office Management - 1; Oratorical English - 1; Orderly - 1; Refrigeration and Air Conditioning - 1; Stationary Engines - 3; Sales, Industrial - 1; Strength of Materials - 1; Traffic Management - 1; Typing - 1;

Mother: Antiques, study of - 1; Banking - 3; Ceramics - 1; Cake Decoration - 3; Drive, Tractor Trailer - 1; English and Spelling - 1; Furniture refinishing - 1; Insurance - 2; Interior Decorating - 3; Kindergarten Teacher - 1; Laundry - 1; Language and Literature - 1; Library Work - 1; Music - 1; Motivational Research - 1; Nursing - 1; Oil Painting - 1; Social Service - 1; Sewing - 6; Advanced Sewing - 4; Typing - 1; Woodworking - 1.

DUTCHESS COUNTY

Dutchess County parents returned 2011 questionnaires of which 989 were signed. The number of responses per school was:

Arlington High School	290
Beacon High School	149
Dover Plains Central School	46
Millbrook High School	101
Our Lady of Lourdes High School	218
Pawling Central High School	57
Pine Plains High School	94
Poughkeepsie High School	482
Red Hook Central School	73
Rhinebeck Central School	65
Roosevelt High School	216
Tivoli Union Free School	20
Wappinger Central School	159
Webutuck Central School	41
Total	2011

Parents Views of Students' Plans

"Do you approve of the choice of vocation or occupation made by your son/daughter?"

	Number	%
Yes	1786	89
No	37	2
Undecided	140	7

Those parents who answered "No" or "Undecided" suggested the following vocations or occupations for their sons/daughters.

Agriculture, forestry and fishing, farming, farm services, etc.	6
Banking	1
Building construction (plumbing, carpentry, painting, etc.)	4
Business office (bookkeeper, secretarial clerical, etc.)	14
Distributive (buyer, sales, advertising, shipping, etc.)	3
Equipment repair (electrical-appliances, heating, etc.)	1
Food services (baker, chef, grocer, waiter, etc.)	2
Government (armed forces, state, federal, etc.)	3
Health services (hospital-aides, dental tech., etc.)	5
Home-making (housewife)	6
Manufacturing-durables (metals, machinery, lumber, electrical, etc.)	3
Personal services (barber, beautician, laundry, tailor, hotels, etc.)	4
Printing and graphic arts (pressmen, commercial artists, etc.)	4
Technician (draftsmen, lab., engineering, electronic, etc.)	6
Public services (police, fireman, etc.)	2
Professional (doctor, lawyer, teacher, engineer, etc.)	28
Other	15

Other: Accounting - 2; Aeronautical Engineer; Airplane Pilot; Budget Manager; Commercial Art; Finance; Mechanic; Music Arts; Nurse - 2; Physical Education Teacher or Athletic Coach; Professional Education; Secretary; "We think students should make this choice." "Son hasn't decided on occupation or vocation."

"Do you approve of the vocation or technical courses your child is taking or wants to take?"

	Number	%
Yes	1733	86
No	47	2
Undecided	85	4

Of those parents who answered "No" or "Undecided", the following are typical comments. Some gave explanations.

"She would like, along with many girls, take beautician course in high. Arlington should have beauty culture."

"Course is not elective. A boy who wants his M.E. should have machine shop - not print shop."

"Because I want her to go to college but she is taking business courses, but I am not interfering."

"Not enough vocational courses offered in high school to be of any particular use."

"She wants to be a beautician and Millbrook school does not teach this course."

"No mechanical course available at schools."

"I do not feel that constructive preparation for commercial art other than drafting is given. (Our students chosen field.)"

"Poor preparation for employment as dental assistant."

"I want him to concentrate on liberal arts."

"Outside of an Industrial Art Course and Business Course there are no other Vocational Courses we're aware of."

"Do you favor expanding programs in vocational and technical education for high school students?"

	Number	%
Yes	1787	89
No	45	2
Undecided	116	6

"Do you favor expanding programs in vocational and technical education for adults?"

	Number	%
Yes	1623	81
No	73	4
Undecided	223	11

The parents selected as most nearly describing their occupations the following:

Occupation	Father	Mother
Professional or technical	500	238
Farmer or farm manager	71	5
Manager, official, or Proprietor	711	59
Clerical	75	263
Sales worker	99	74
Craftsman or foreman	304	12
Semi-skilled operator	160	74
Private House Worker	6	28
Service worker	199	94
Farm laborer or farm foreman	15	2
Homemaker (housewife)	4	1089
Other (checked only)	12	15

The following table indicates the highest grade completed by the parents who returned questionnaires. The number under the grade number indicates the number of parents in the county who report having completed that grade.

	Elementary								High School						College or Technical Institute					
Year	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
Father			4	4	5	14	16	174	80	161	135	683	75	126	45	157	58	31	68	2
Mother	2		1	2	2	4	11	120	70	158	133	839	107	101	81	137	44	5	6	

Parents indicated specialized training in the following fields:

	Father	Mother
Registered Nursing	11	94
Business School	83	281
Apprentice	82	8
Trade (not apprentice)	168	24
Armed Forces (Technical)	375	32
Other	191	137

Under "Other" specialized training the fathers and mothers reported a wide variety of training with relalively few in the same field.

The 2011 parents who returned questionnaires expect their children will complete grades in school as indicated by the following table. The second line indicates the total for each grade.

	High School				College				Other			
Grade	9	10	11	12	13	14	15	16	1	2	3	4
		5	2	470	17	262	16	908	76	77	50	64

In the "Other" category the parents included the following: Airline Stewardess - 2; Armed Forces - 2; Art School - 2; Beautician School - 20; Business School - 49; Cooking (Chef) School - 2; Dental Assistant Training - 2; Dramatic Art - 1; Modeling School - 2; Nursing - 48; Post Graduate College - 24; Social Work - 1; Technical School - 9; Therapy School - 1; Theology - 2; Trade School - 10; Vocational School - 6;

The following are some typical suggestions which were made by the parents in Dutchess County regarding vocational-technical education programs.

"Need for training in Programming, other technical work for I. B. M."

" I would like to see vocational or trade school started again."

"There is a definite need for automotive mechanics in General repairs and also in specialized repairs--our lives are in the hands of incompetents and illiterates."

"Maybe too much emphasis placed on need for higher education for high school graduates not capable or qualified for ivy league schools. Maybe we should consider using high school facilities days, nites, summers, for specialization in trades. Why not P. G. course for auto mechanics, plumbers or retailing?"

"In many areas, there is one central vocational school to which all vocational students go at varying times. Saves expense of each of a dozen schools furnishing one of its own. Surely, this would be more practical than individual schools: - a wider variety of vocational studies, and fewer teachers would more than compensate for the cost of his transportation. Same idea as our communal summer school."

"Our son has wanted to take vocational-technical courses in high school. However because of the pressure of college entrance requirements he was unable to do so. We suggest that provision be made within the framework of college preparation programs for electing some vocation-technical courses."

"Expanded vocational education opportunities and programs should be offered within the framework of the present secondary school system. There should NOT be a separate vocational or technical high school, because any advantages such a school set up would offer far outweighted by the disadvantage of its tending to become a 'dumping ground for the misfits'. Furthermore not only do many students need vocational training at the secondary-school level (because they are not 'cut out' for the traditional college taught professions), but also many students who should and are going on to college-level education could profit from a smattering at least of the practical, nuts-and-bolts application of things (lest they become too 'blue sky' bound in their approach to life). Thus vocational training within the 'regular' high-school framework would tend to create this atmosphere of desirable balances between 'practical' and 'blue sky' for the college-bound student."

"We believe that further vocational training is vitally needed in this area."

"To prevent school drop-outs and to make these potential drop-outs into qualified workers in various fields, there should either be a vocational school in the area or the high-schools should be expanded to give qualified vocational training such as auto mechanics, tool making, woodworking, etc. beautician aut et al.

While we build more and more schools, I feel we are sadly neglecting these children who cannot conform or stick to a regular high school program. BUT who could be trained for a useful vocation. They may be the minority group but what a terrible waste of American youth that could, with the proper training take a useful purposeful place in life. So many of these drop-outs drift from job to job or wind-up first in Family court and later in County court."

"Should be centrally located-provide broad range of courses-comprehensive enough to fit students from large and small schools for employment in local industry upon graduation. Possibly broadening facilities should be provided for students living at a distance."

"Teaching of specific skills might not be as important as teaching of proper habits of works and attitudes, following directions, getting along with others, taking criticism and supervision. Many industries prefer to do on-the-job training. Job-readiness is the job of the vocational training program."

"Hope this program becomes effective soon. Too much stress has been put upon college education to the detriment of the boys and girls not equipped for it. Those who do not go on to college are, for the most part, ill-prepared to earn a decent living with any future to it. They may flounder around for several years before finding their niche."

"I will favor expanding vocational training if a need is shown. I am awaiting the results the results of this survey."

"I do feel that a definite need for a vocational type of high school exists in this area. However, I am afraid that if it is started, it will wind up as a 'dumping' ground for every 'disciplinary' and hard to educate pupil in the school district."

"Should be locally sponsored and financed. Should be tailored to the needs of local people in training for local industries."

"Many students have no interest in academic studies. The vocational schools are not in sufficient number to cope with this situation."

"Perhaps the parents of 7th and 8th graders would appreciate a survey of this type. Congratulations to all superintendents for this step."

"I believe that the Beacon Area is in need of a trade school."

"Aid must be given to those drop-outs not capable of even-attending vocational school, their number is ever increasing."

"In this area where many of the people work in the two state institutions, some sort of pre-nursing training should be given."

"In this area (Dover) where most of population is employed in State Hospital or State School, pre-nursing training should be considered as many become attendants."

"My only fear for vocational technical program in high school is that some potential college students get in it by faulty guidance."

"More opportunities for adult education."

"Vocational and job training for the mental and physical handicapped."

"I think boys and girls should share on-the-job experience such as lathe operators, etc. for boys maybe hair-dressing for girls by having an hr. or two eack wk. in their program schedule enabling them to do so."

"There is a desperate need in this area for a good vocational high school! Maybe this would take enough students out of the academic high schools to ease the over crowded conditions."

"Evening courses should be available for adults who wish to further their skills."

"The slow learning high school students need more opportunities for technical training in the high school. Large high schools have these opportunities, but there is more of this type of education needed in our smaller schools."

"Every student taking a college course should be made to take additional courses so he could, if he left school at the completion of 12 years, be fitted for some employment."

"This area definitely needs a vocational high school. The emphasis and attention in our present high school is geared to the college bound student. Non regents students take second place. It is from this latter group that the majority of our drop-outs come. It would be a great incentive to these people to finish high school, if they felt they were learning a useful occupation at the same time. It would cut down on delinquency and our increasing number of unskilled, unemployed laborers."

"I would be wise to take a look at the European system where students not wishing to attend college would be trained for a specific job."

"Data Processing Programming."

"Courses in computor programming are becoming popular."

"Tailor some of the programs to the anticipated needs of business and industry in the General Geographic area we live in. "

"Certainly agree with the study guide! It's time something was done about it. My company is always unable to find enough trained people--secretaries electronic technicians or 'what have you' (cooks for the cafeteria are as scarce as technicians."

"I believe the student should have more general training in varied subjects the first two years of H. S. until they can be sure of their chosen vocation.

"Build it and fast."

"Although I said "yes" to number five, I do think that the problem should be solved in two separate schools. One for college entrance and the other for vocational training."

"New York State is 20 years behind many other states in vocational schools."

"If training courses such as the following (or some other course you wish to add) were offered in an evening school in this area, would you be interested in enrolling in one of these programs?"

In answer to this question 472 fathers and 714 mothers expressed interest in enrolling in one of the programs listed below. These 1186 parents represent 59% of those returning questionnaires.

	Father	Mother
Agricultural Machinery Technology	17	3

PUTNAM COUNTY

Putnam County parents returned 392 questionnaires of which 157 were signed. The number of responses per school was:

Brewster	144
Carmel	69
Haldane	53
Mahopac	126
Total	392

Parents Views of Students' Plans

"Do you approve of the choice of vocation or occupation made by your son/daughter?"

	Number	%
Yes	364	98
No	5	1
Undecided	21	5

Those parents who answered "No" or "Undecided" suggested the following vocations or occupations for their sons/daughters,

Agriculture, forestry and fishing, farming, farm services, etc.	2
Amusement-Entertainment (actor, announcer, sports, etc.)	1
Business office (bookkeeper, secretarial, clerical, etc.)	2
Government (armed forces, state, federal, etc.)	3
Personal services (barber, beautician, laundry, tailor, hotels, etc.)	1
Professional (doctor, lawyer, teacher, engineer, etc.)	6

Other: Cabinet maker, mathematician, something professional, cartographer stockbroker, statistician, labor relations, nun.

"Do you approve of the vocation or technical courses your child is taking or wants to take?"

	Number	%
Yes	359	91
No	9	2
Undecided	11	2

Those parents who answered "No" or "Undecided" made the following comments:

"I prefer doctor to engineer."

"I approve the Business school he is going to go to--I do not approve of the course planned out by the school. He is not qualified as a graduate to to out and make a living."

"Not extensive enough."

"I do not agree with her plans to go on as a practical nurse because she has much better qualifications."

"I do not understand what it means except that he wants to do something in flying."

"No need for it."

"Not enough equipment--no business machines."

"Daughter is taking college preparatory course."

"Do you favor expanding programs in vocational and technical education for high school students?"

	Number	%
Yes	353	90
No	9	2
Undecided	23	5

"Do you favor expanding programs in vocational and technical education for adults?"

	Number	%
Yes	311	79
No	25	6

Farm laborer or farm foreman	1	1
Homemaker (housewife)	2	211
Other: Well driller, Secretarial	4	4

The following table indicated the highest grade completed by the parents who returned questionnaires. The number under the grade number indicates the number of parents in the County who report having completed that grade.

Year	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
Father		2	1		4	4	2	42	21	36	30	140	8	77	7	17	9	8	9	
Mother					1	5	7	21	15	24	29	182	21	21	9	18	7		1	

Parents indicated specialized training in the following fields:

	Father	Mother
Registered Nursing	0	14
Business School	15	62
Apprentice	27	2
Trade (not apprentice)	39	7
Armed Forces (Technical)	78	3
Other	36	29

Under "Other specialized training" the 36 fathers and the 29 mothers report the wide variety of training with rarely more than two in the same field.

The 392 parents who returned questionnaires expect their children will complete grades in school as indicated by the following table. The second line indicates the total in each grade.

	High School				College				Other			
Grade	9	10	11	12	13	14	15	16	1	2	3	4
				99	7	45	3	166	23	22	11	9

Of the 65 parents who mentioned "Other", Business School was listed 19 times; Nursing School - 15; Post-graduate School - 4; Secretarial School and Law School - 3 times each; Graduate School, Masters degree, Art School, and Medical School - 2 times each. Of the fourteen plans for other training mentioned only once, R.C.A. School, Automotive Mechanics, and Barber School were the only ones specific enough to record.

The following suggestions were made by parents in Putnam County regarding vocational-technical education programs:

"I feel the schools in Putnam County should offer schooling in woodwork, cabinet making, agriculture, nurse training vocations."

"Expand the present program."

"Industry could absorb all graduates of a two or three year machine shop."

"I would suggest the programs be flexible enough to provide a transition to the changes taking place in the Technology of present trades."

"Before merging now existing high schools such as Mahopac, Carmel, and Brewster, has there been any study of the need for a vocational and technical school in Putnam County for the students who are not going to a four year college? Just an idea."

"Let us keep it in moderation. The cost is too great. I think the four years in high school should be spent in educating the minds and not in training for proficiency at a skill. Let us educate, not train."

"I am very much in favor of vocational technical training. So many students are not capable of academic studies, and this sort of training would be very valuable to them."

"I think this is an excellent idea if the decision to enroll a child in such courses is not made in haste, or for the convenience of either the school or the parents. In effect, I believe a child can be average or below in school, have an aptitude for mechanics, and still become one of our great writers, artists, directors, etc."

"Wonderful if the same recognition is given. A talented child taking vocational-technical training, and this child is not looked down upon as stupid by teachers and administrators."

"Should have had this type training available years ago. "

"If training courses such as the following (or some other course you wish to add) were offered in an evening school in this area, would you be interested in enrolling in one of these programs?"

In answer to this question, 115 fathers or 29% of the parents who returned questionnaires, together with 158 or 40% of the mothers, expressed interest in enrolling in one of the programs listed below.

	Father	Mother
Auto Mechanics	5	2
Auto Body Repair and Service	6	0
Agriculture Sales and Service	2	0
Beauty Culture	1	16
Bookkeeping	1	14
Business Machine Operation	3	20
Carpentry and Building Construction	16	0
Clerk-typist and Receptionist	0	19
Commercial Art	0	10
Custodian Service	2	1
Drafting (Mechanical)	6	0
Dental and Medical Technology	1	8
Electric Appliance Repair	10	1
Electricity	11	0
Electronics Technology	10	1
Farm Operation and Management	3	0
Food Preparation and Service	1	12

Other	14	13

Some "Other" courses listed were Sewing mentioned three times and the following mentioned but once: The letter in parentheses following the course name indicates "F" for father and "M" for mother. Insurance - (M), Blue Print Reading - (F), Music Appreciation - (F), Public Speaking - (F), Business Law - (M), Psychology - (M, F), Business Management - (M), Dress Designing and Interior Decorating - (M), T.V. Repair - (F), Woodworking Trade - (F), Real Estate - (F), Income Tax Filing - (M), Insurance - (F), Meteorology - (F), Switchboard - (M), Ham Radio and Typing - (F), Oil Burners and Controls - (F), Furniture Refinishing - (M), Programmer; Data Processing - (F), and Driver Education - (M).

TRI-COUNTY SUMMARY

Tri-County parents returned 3318 questionnaires of which 1559 were signed. The number of responses per county was:

Columbia	915
Dutchess	2011
Putnam	392
Total	3318

Parents Views of Students' Plans

"Do you approve of the choice of vocation or occupation made by your son/daughter?"

	Number	%
Yes	2955	89
No	63	2
Undecided	238	7

"Do you approve of the vocation or technical courses your child is taking or wants to take?"

	Number	%
Yes	2885	87
No	79	2
Undecided	146	4

Parents Views Regarding Expansion of Vocational and Technical Education

"Do you favor expanding programs in vocational and technical education for high school students?"

	Number	%
Yes	2983	90
No	68	2
Undecided	187	6

"Do you favor expanding programs in vocational and technical education for adults?"

	Number	%
Yes	2685	81
No	125	4
Undecided	377	11

Parent Interest in Evening School Training

"If evening courses were offered in this area, would you be interested in enrolling in one of these programs?"

Father			Mother		
	Number	%		Number	%
Yes	863	26	Yes	1276	38
No	1598	48	No	1524	46

The total number of parents who said "yes" as indicated above (2139) represents 79% of the number (2685) who voted in favor of expanding programs in vocational and technical education for adults.

There were a total of 406 "write-in" comments regarding parents' viewpoints to an area vocational-technical school program. Of the total "write-in" comments 362 or 89% were strongly favorable; 22 or 5% were unfavorable; 22 or 5% raised significant questions regarding the implementation of the study.

SECTION VII

THE CLASS OF 1962

A complete study of the occupational needs of young people who are preparing themselves for entering employment should include some information about those who recently attended high schools in the tri-county area. The "class of 1962" was selected for this purpose since educational leaders in the survey area felt that the members of this class had been away from high school long enough to have formed some definite opinions with respect to the value of the kind of high school education they had received.

The information in this section of the study has been tabulated from replies to a questionnaire addressed to this group and is reported separately by county in the same manner as other sections of this survey.

During September 1964 questionnaires were mailed to those registered in the ninth grade in September 1958. These students would normally be expected to graduate from high school in 1962.

COLUMBIA COUNTY

Six hundred and fifty seven questionnaires were mailed by the county high schools as follows:

	Number mailed	Number returned	Percent returned
Chatham	72	18	25
Germantown	25	6	24
Hudson	214	87	41
Ichabod Crane	111	27	24
New Lebanon	82	19	23
Ochawamick	50	28	56
Roeliff Jansen	72	49	68
Saint Mary's Academy	31	18	58
Total	657	252	38

The returns were from 120 boys and 132 girls.

In answer to the question, "What grade have you completed in school?", the distribution was as follows:

High School Grade					College Year			
8	9	10	11	12	1	2	3	4
1	7	9	4	93	24	114	0	0

The "In-College" Group

One hundred and eighteen reported that they are now in college; fifty-six boys and sixty-two girls. This represents forty-seven percent of the questionnaire population and eighteen percent of the class of 1962.

Thirty eight are registered in public colleges or community colleges in New York State; fifty two in private colleges in New York State, and twenty five are attending out-of-state colleges. Three have completed their college education.

The Number in College by School

School	Boys	Girls	Total	Percent of School's Questionnaires Returned
Chatham	3	8	11	61
Germantown	2	2	4	67
Hudson	19	19	38	44
Ichabod Crane	4	6	10	37
New Lebanon	4	7	11	58
Ockawamick	4	6	10	36
Roeliff Jansen	17	8	25	51
Saint Mary's Academy	3	6	9	50

One hundred and four liked academic subjects best in high school while thirteen preferred non-academic subjects. Six reported that they did not feel that their high school work had helped them in employment. All who answered the question stated that their parents had encouraged them to continue in school.

The college students reported their "major field" including the following:

Field	Number	Field	Number
Accounting	1	Industrial Arts	1
Animal Husbandry	1	Journalism	1
Art	1	Liberal Arts	4
Business Administration	7	Landscape Architecture	1
Biology	2	Marketing	1
Chemistry	2	Mathematics	2
Classical Civilization	1	Mechanical Design	1
Classical Language	1	Medical Technology	2
Commerce and Finance	1	Metal Laboratory	1
Construction Technology	1	Music Education	2
Economics	2	Nursing	17
Education	20	Photography	1
Electronics	2	Physics	2
English	11	Political Science	1
Engineering	8	Pre-law	1
Finance	1	Printing	1
Forestry	2	Psychology	5
Government	1	Public Health	1
History	4	Secretarial Science	1
Home Economics	1		

A selection of typical comments made by these college students about their school life includes the following:

> "The study habits I acquired in high school have been beneficial in studying nursing."

> "A better guidance department--to give more information on subjects to study in high school and on schools or colleges to attend after graduation."

> "Wish high school offered more in reading improvement and speed reading."

> "As I have gone on in school I have found it more enjoyable and less of a chore."

> "I had almost no interest in my subjects at this time. Vocational training would have been far more beneficial in my case."

"Had some very excellent, well qualified teachers - especially in the science and mathematics field."

"Enough help is not given to the students in choosing their occupations; participation in a program where he could get a taste of his preferred occupation would be a big help."

"It seems to me that the teacher "taught for the Regents" - Their record is based too much on their student's regents performance, the exams themselves not being very hard, thus the more able students weren't challenged enough."

"Not too well-rounded and subjects of choice limited."

"I believe that my enjoyment of school life while in high school has been one of the leading factors in my decision to enter the teaching profession. I am looking forward to it."

Out-of-School Group

One hundred and thirty four reported that they had left school; fifty seven boys and seventy seven girls. This represents fifty three percent of the returned questionnaires and twenty percent of the "class of 1962."

The following table indicates the number of students who discontinued their education by school:

School	Boys	Girls	Total	Percent of School's Questionnaires Returned
Chatham	1	6	7	39
Germantown		2	2	33
Hudson	22	27	49	56
Ichabod Crane	6	11	17	63
New Lebanon	6	2	8	42
Ockawamick	8	10	18	64
Roeliff Jansen	11	13	24	49
St. Mary's Academy	3	6	9	50
	57	77	134	

The following is a list of reasons for not completing high school:

Reason	Number
Need for you at home	4
Difficulty in academic subjects	5
Lack of subjects which you felt would be useful to you	2
Bored with school work	9
Money reasons	4
Need to go to work	5
Marriage	4
Military Service	7

Twenty seven of the non-college group liked academic subjects while in high school and one hundred three preferred "non-academic." Sixty six felt that high school training had helped them in employment while thirty eight felt that it had not helped. Only nineteen reported that their parents had not encouraged them to remain in school. Most had held one or more jobs before their present employment. Eighty six reported that they are now employed. Seventeen indicated that they are unemployed and thirty one gave no answer to this question. Those employed indicated the following types of work:

Occupation	Number	Occupation	Number
Accounting	1	Manufacturing	8
Aircraft Service	1	Meteorology	1
Automechanics	2	Parts Man	1
Bank Teller	2	Plumbing	1
Barber	1	Practical Nurse	2
Beautician	4	Nursing Work	2
Baby Sitter	2	Printer	1
Carpentry	3	Reporter	1
Cashier	1	Retailing	7
Clerical	14	Secretarial	11
Dential Hygiene	1	Services of U. S.	13
Dress Maker	1	Steam Fireman	1
Electronics	3	Surveying	1
Farming	1	Taxidermy	1
Housewife	13	Technician	2
Laborer	8	TWX-PBX Operator	1
		Waiter	1

Seventy-eight indicated that they were satisfied with their work. Thirty-six reported that they were not satisfied.

Eighty would like a better paying job of the same type while twenty-eight would not.

Sixty-eight indicated that they would be interested in one of the programs listed below if offered in an evening school.

Course	Number Interested
Agricultural Machinery Technology	1
Auto Mechanics	4
Auto Body Repair and Service	5
Beauty Culture (Cosmetology)	3
Bookkeeping	4
Business Machine Operation	8
Business Math	1
Carpentry and Building Construction	5
Clerk-Typist and Receptionist	5
Commercial Art	3
Drafting (Mechanical)	1
Dental and Medical Technology	1
Electric Appliance Repair	1
Electricity	3
Food Preparation and Service	2
Homemaking	2
Landscaping and Horticulture	2
Machine Trades	1
Plumbing and Heating	1
Practical Nursing	2
Retailing (Salesmanship, Merchandising)	2
Secretarial or Stenographic Work	9
Textile Fabrication	1
Welding	1

In reply to the question, "In place of evening instruction, would you prefer instruction on an apprentice basis?"; forty-four said "Yes" and thirty-six "No".

Forty-six would prefer instruction given part time on-the-job and part time in school. Thirty-two said "No" to this.

"Would you take advantage of any training opportunity which might be offered even if some travel time were necessary?"

Yes 75 No 24

"Do you believe that with more training and skill development you could be happier and more successful in your work?"

Yes 95 No 24

Would like to be notified of new training programs when they are started in their area:

Yes 96 No 25

Learning and Work Preferences. The respondents were asked questions with respect to this work preference:

Prefer to work alone 45: With a crew 72

Enjoy most work which deals with:	People	73
	Things (materials)	47
	Books	9
Feel that I learn most easily from:	Books	27
	Pictures	10
	Demonstrations	94

The following is a selection of suggestions which were made by the non-college group:

"I figure a good way for people to get a trade and become skilled is for them to get a two-year trade school from a company they work for, or join the navy."

"I think beauty school should be at least a one year course instead of six months. There's too much to learn in that length of time."

"I would appreciate help in finding employment after graduation from beauty school."

"Yes - a vocational school closer to my home - nearer than Albany."

"New adult education courses at Public High School. Desire for a business machine course in the future."

"Experience and theory grouped together are far superior to one without the other."

"I believe the teachers do not push the students hard enough about learning."

"The teachers should pay more attention to the slow hard worker than to the child that gets subject matter quickly."

"I wish I was back in school."

"I wish I had continued. The only jobs I can get are waitress and factory. If anything happended to my husband I'd have to work and those jobs don't pay."

"The teachers today do not have enough time to help the people that the work comes hard to. They just help the ones that know everything and don't really need their help."

"I feel that it is most important to try and decide what definite field one wishes to enter before high school begins. I started business courses only in my junior year and Iwish very much that I had had four full years of business training instead of only two"

"I believe high school was helpful but one year of college was not much more helpful."

"I should have stayed in school."

"Too smart for my own good. Thought that leaving would make no difference."

"I don't regret the fact that I attended nursing school. It was a good experience."

"There should have been more on-the-job participation and projects in auto mechanics."

"They were very educational years. Taking a secretarial course has helped me to have the good job I now have."

"I feel my four years should have been spent more on a skill than on things of the past."

"The only thing I'd like to comment on are the Guidance Counselors. I believe they should help a student in doing what he is interested in, not discouraging jobs held since leaving school. As the case has been in plenty of girls who have graduated wishing to become beauticians; because they have taken business courses. What else could they have taken to help them."

DUTCHESS COUNTY

Over one thousand six hundred and thirty-five questionnaires were mailed to County High Schools as follows:

	Number mailed	Number returned	Percent returned
Arlington H. S.	No data	88	—
Beacon H. S.	192	70	36
Dover Jr.-Sr. H. S.	40	9	23
F. D. Roosevelt H. S.	214	69	32
Millbrook H. S.	26	16	61
Our Lady of Lourdes H. S.	174	103	59
Pawling Central S.	35	23	66
Pine Planis C. S.	67	23	36
Poughkeepsie H. S.	531	206	39
Red Hook C. S.	76	35	46
Rhinebeck C. S.	58	34	58
Tivoli U. F. S.	No data	—	—
Roy C. Ketcham H. S.	190	93	50
Webutuck C. S.	32	8	25
	1635	777	

The returns were from 377 boys and 397 girls, plus 3 unmarked.

In answer to the question, "What grade have you completed in school?", the distribution was as follows:

High School Grade					College Year			
8	9	10	11	12	1	2	3	4
0	16	24	20	223	80	303	12	2

Of the returned questionnaire population one hundred and seventy-six or twenty-three percent reported that they had failed one or more subjects in high school.

The In-College Group

Four hundred reported that they are now in college; two hundred and twenty-one boys and one hundred and seventy-nine girls. This represents fifty-one percent of the questionnaire population and about twenty-four percent of the class of 1962.

One hundred and fifty-eight are registered in Community Colleges or four-year Colleges of the University of the State of New York, one hundred and forty-seven in private colleges in New York State, and ninety-two are attending out-of-state colleges. Three did not name their college.

The Number in College by School

	Boys	Girls	Total	Percent of school's Questionnaires returned
Arlington H. S.	23	20	43	49
Beacon H. S.	17	15	32	40
Dover Jr. and Sr. H. S.	0	2	4*	44
F. D. Roosevelt H. S.	19	15	35**	50
Millbrook H. S.	4	1	5	31
Our Lady of Lourdes	40	28	68	66
Pawling C. S.	4	6	10	43
Pine Plains C. S.	6	6	12	52
Poughkeepsie H. S.	63	37	100	49
Red Hook H. S.	6	11	17	49
Rhinebeck C. S.	9	6	15	44
Tivoli U. F. S.	No data	—	—	—
Roy C. Ketcham	25	28	53	57
Webutuck C. S.	2	4	6	75
	221	179	400	

Three hundred and fifty-two liked academic subjects best in high school while twenty-eight liked non-academic subjects.

Three hundred and thirty-nine stated that their parents had encouraged them to continue in school. Twenty-one replied in the negative while forty did not answer this question.

*Sex not reported (2)

A selection of typical comments made by these college students about their school life include the following:

"I believe that vocational courses would be good."

"I think that high school should be run on more of a college level."

"My elementary school teacher must have done an excellent job motivating me for I have thoroughly enjoyed my school work ever since."

"... The only criticism is a lack of personal choice in the curriculum and constant pressure academically."

"My school life was most enjoyable and I feel my education in high school adequately prepared me for college."

"I feel that my education was as adequate as it could have been considering the size of the school. A larger high school could offer more and better programs."

"Very enjoyable-highest academic subjects should have been given to those who could handle them."

"_____ should have a vocational school."

"Honors classes gave good college preparation."

"It was fair. Schools should offer trades."

Out-of-School Group

Three hundred and seventy-seven reported that they had left school: one hundred and fifty-nine boys and two hundred and eighteen girls. This represented about fifty percent of the returned questionnaires and about twenty-three percent of the class of 1962.

The following table indicates the number of students who discontinued their education by school:

School	Boys	Girls	Total	Percent of school's Questionnaires returned
Arlington H. S.	19	26	45	51

Reasons for Not Completing High School

Physical illness	11
Need at home	18
Difficulty in academic subjects	51
Lack of subjects felt to be useful to the student	30
Bored with school work	81
Money reasons	35
Need to go to work	44
Marriage	29
Military service	18

Students were permitted to check as many items as applied to them. Two hundred and seventy-one reported having completed twelve or more grades before leaving school. Sixty-four had left school before high school graduation.

Age of Leaving School

Age	15	16	17	18	19	20
Number	1	20	31	19	13	7

One hundred and twenty-six liked academic subjects while in high school and one hundred and ninety-two preferred non-academic.

One hundred twenty-three felt that high school training had helped them in employment while seventy-seven felt that it had not helped.

Only twenty-four reported that their parents had not encouraged them to remain in school.

One hundred and thirty-nine reported having held one or more jobs before the one in which they are now employed.

Three hundred and five listed the type of work in which they are now engaged. Forty-eight indicated that they were unemployed and twenty-four did not answer this question.

Those presently employed indicated the following types of work:

Occupations Reported by Young Workers

Occupation	Number	Occupation	Number
Agent	2	Driver	2
Auto mechanic	6	Electrical Work	6
Bank teller	3	Engineering Apprentice	3
Barber	1	Fireman, steam	1
Beautician	5	Gas station attendant	1
Bookkeeper	6	Guard	1
Building	4	Hospital services	9
Bus driver	1	House wife	34
Butcher	1	Housework	2
Carpenter	6	Interior decoration	1
Cashier	3	Key punch operator	3
Clerical	11	Laborer	3
Computer operator	2	Machine operator	9
Cook	1	Manufacturing	14
Counselor	1	Manager	9
Dental assistant	2	Meat cutter	1

(continued)

Occupations Reported by Young Workers (continued)

Occupation	Number	Occupation	Number
Mechanic	3	Secretarial	52
Military service	54	Service on equipment	2
Nursing	4	Stenographer	3
Nurse, Reg.	1	Surveyor	1
Nurse, Lic. Prac.	2	Teacher	1
Painter	1	Telephone operator	2
Plumber's apprentice	2	Tool maker apprentice	1
Printing	1	Typist	5
Receptionist	2	Waitress	5
Repair work	3	Window display	2
Sales work	4		

One hundred and sixty-seven reported that they were satisfied with their work while sixty-eight indicated that they were not satisfied.

One hundred and forty-one would like a better paying job of the same type while sixty-five would not.

One hundred and fifty-two indicated that they would be interested in one of the programs listed below if offered in an evening school:

Course	Number
Agricultural machinery technology	3
Auto mechanics	7
Auto body repair and service	2
Beauty culture	9
Bookkeeping	7
Business machine operation	17
Business math	5
Carpentry and building construction	5
Clerk-typist and receptionist	11
Commercial art	3
Custodial service	1
Drafting (mechanical)	10
Dental and medical technology	6
Electrical appliance repair	1
Electricity	7
Electronics technology	6
Food preparation and service	1
Homemaking	2
Household art and decoration	7
Landscaping and horticulture	2
Machine trades	4
Practical nursing	11
Printing	1
Retailing (Salesmanship, Merchandising)	3
Secretarial or stenographic work	15
Sheet metal work	2
Welding	4

In reply to the question, "In place of evening instruction, would you prefer instruction on an apprentice basis.", eighty-four said "Yes" and eighty-six "No".

One hundred and fifteen would prefer instruction given part time on-the-job and part time in school. Forty-eight said "No" to this.

"Would you take advantage of any training opportunity which might be offered even if some travel time were necessary?"

Yes 144 No 52

"Do you believe that with more training and skill development you could be happier and more successful in your work?"

Yes 190 No 43

"Would you like to be notified of new training programs when they are started in your area?"

Yes 197 No 52

Learning and Work Preferences

The respondents were asked questions with respect to their work preference:

Prefer to work alone 113: With a crew 126

Enjoy most work which deals with:	People	177
	Things (materials)	85
	Books	15
Feel that I learn most easily from:	Books	71
	Pictures	6
	Demonstrations	203

The following is a selection of suggestions which were made by the non-college group:

"Retailing courses would help me."

"Considering the job demand in the area, secretarial skills and mathematical skills are absolutely essential to everyone including those college-bound. Consider IBM."

"I feel that if I had the opportunity of selecting a vocational training course in high school I would have remained in school, as I am sure it would have been very beneficial."

"I would like on the job training on a pay basis."

"Learning by seeing and doing rather than out of a book is more helpful than any other method of teaching."

"I would like to be able to take a course in key punching."

"Specifically, printing should be more advanced (offset, photoengraving, variatype) along with classes you now have."

"I believe making it a three year course with more time given to other subjects for future use would be more satisfactory."

"A trade school instead of the eleventh and twelfth grades would have been more beneficial to me."

"Through experience I have found naval training schools more interesting than civilian school. I think it wise to use this method of training in vocational schools if possible."

"On the job training is an exemplary way to teach. As a student of this type training in the air force, I witnessed the great results this training can produce."

"I feel if I had more assistance on what sort of course or subjects to take I might have done better."

"I was encouraged to take college entrance and found it too difficult, but stayed with it anyway. I think parent and student advisers should let students decide their own courses and just be there to help and guide."

"Disappointed that no agricultural course was offered."

"They don't give you enough practical courses such as typing, and guidance programs for choosing a school for continued education is sadly lacking."

"I was very foolish to have quit school. I know now how important an education is."

"I would like _____ Central to have vocational courses."

"I would like to finish school in evening courses if I could. Then become a commercial artist."

PUTNAM COUNTY

Two hundred and ninety-seven questionnaires were mailed by the County High Schools as follows:

	Number mailed	Number returned	Percent returned
Brewster C. H. S.	61	3	5
Carmel C. H. S.	114	47	41
Haldane C. H. S.	52	30	58
Mahopac C. H. S.	70	33	47
	297	113	

The returns were from fifty boys and sixty girls. Sex not tallied, three.

In answer to the question, "What grade have you completed in school?", the distribution was as follows:

High School Grade					College Year			
8	9	10	11	12	1	2	3	4
0	4	4	3	51	14	36	1	0

Of the returned questionnaire population sixty-one or fifty-four percent reported that they had failed one or more subjects in high school; sixteen in the In-College Group, and forty-five in the Out-of-School Group.

The In-College Group

Forty-eight reported that they are now in college; twenty boys and twenty-six girls. Sex not tallied two. This represents forty-three percent of the questionnaire population and sixteen percent of the class of 1962.

Nineteen are registered in New York State or Community colleges, sixteen in private colleges in New York State, and thirteen are attending out-of-state colleges.

The Number in College by School

	Boys	Girls	Total	Percent of school's Questionnaires returned
Brewster C. S.	0	2	2	—
Carmel C. S.	8	11	21*	45
Haldane C. S.	6	3	9	30
Mahopac C. S.	6	10	16	49
	20	26	48	

*Sex not reported (2)

Forty-three liked academic subjects best in high school while five liked non-academic subjects.

Forty-five stated that their parents had encouraged them to continue in school. One replied in the negative while two did not answer this question.

The college-student reports on "major field" included the following:

Field	Number	Field	Number
Accounting	1	International Affairs	1
Agriculture	1	Languages	1
Business	4	Liberal Arts	1
Chemical Technology	2	Mathematics	1
Chinese	1	Machine design	1
Economics	1	Medical Secretary	1
Education, Biology	1	Music	1

Education, Health & Physical	1	Philosophy and Theology	1
Education, Secondary	1	Physics	1
Education, Social Science	1	Political Science	3
Engineering	4	Psychology	1
English	2	Spanish	1
French	1	Speech Therapy	1
History	4		

A selection of typical comments made by these college students about school life include:

> "By attending college I now see the importance of establishing good study habits also the need for further education."
>
> "Students involved in the academic curriculum generally are advised and directed to take only academic courses. These are not preparation for work after school."
>
> "To me high school was a challenge."
>
> "School officials helped overcome barriers to physically disabled."

Out-of-School Group

Sixty-five reported that they had left school; thirty boys and thirty-five girls. This represented fifty-seven percent of the returned questionnaires and about twenty-two percent of the class of 1962.

The following table indicates the number of students who discontinued their education by school:

School	Boys	Girls	Total	Percent of School's Questionnaires Returned
Brewster C. H. S.	0	1	1	—
Carmel C. H. S.	11	15	26	55
Haldane C. H. S.	11	10	21	70
Mahopac C. H. S.	8	9	17	51
	30	35	65	

Reasons for Not Completing High School

Reason	Number
Difficulty in academic subjects.	4
Lack of subjects felt to be useful to the student.	1
Bored with school work.	2
Need to go to work.	1
Marriage.	1
Military service.	3

Fifty-four reported having completed twelve or more grades before leaving high school. Eleven had left school before high school graduation.

Age of Leaving School

Age	15	16	17	18	19
Number	0	3	2	6	4

Twenty-three liked academic subjects while in high school and thirty-eight preferred non-academic.

Twenty-three felt that high school training had helped them in employment while sixteen felt that it had not helped.

Eight reported that their parents had not encouraged them to remain in school.

Forty-two reported having held one or more jobs before the one in which they are now engaged.

Sixty listed the type of work in which they are now engaged. Ten indicated that they were unemployed. Undoubtedly five of the unemployed were people who considered either housework or the military unemployment.

Those employed indicated the following types of work:

Occupation	Number	Occupation	Number
Auto Mechanic	1	Laborer	1
Auto Supply	1	Maintenance	1
Bookkeeper	1	Manufacturing	5
Cashier	2	Mechanic	1
Characterization Tech.	1	Military Service	7

Machine Trades	1
Plumbing and Heating	1
Practical Nursing	1
Retailing (Salesmanship, Merchandising)	2
Secretarial or Stenographic Work	4
Welding	2
Physical Education	1
Refrigeration and Air Conditioning	1

In reply to the question, "In place of evening instruction would you prefer instruction on an apprentice basis.", twenty said "Yes" and twenty-five "No".

Twenty-five would prefer instruction given part time on-the-job and part time in school. Seventeen said "No" to this.

"Would you take advantage of any training opportunity which might be offered even if some travel time were necessary?"

Yes 38 No 10

"Do you believe that with more training and skill development you could be happier and more successful in your work?"

Yes 47 No 5

"Would you like to be notified of new training programs when they are started in your area?"

Yes 47 No 5

Learning and Work Preferences

The respondents were asked questions with respect to their work preferences:

Prefer to work alone 20; With a crew 23.

Enjoy most work which deals with:	People	28
	Things (materials)	22
	Books	6
Feel that they learn most easily from:	Books	11
	Pictures	4
	Demonstrations	41

The following is a selection of suggestions from the out-of-school group:

"From previous experience, instruction on-the-job as well as classroom work, is extremely helpful and I would encourage more of this."

"Have a close coordination between classroom study and on-job training, equal amounts of each."

"It's difficult to obtain a job which you are just starting new. A job placement center at school would help."

"A sounder knowledge of those subjects in school related to Math., English and practical knowledge plus the encouragement and reason for knowing these."

"Rather than have a half-day of class and a half-day of work, I believe that classes should be on an every-other week basis, therefore, it would cut down on travel time and increase educational time."

"Instructors should be part-time instructors who participate fully in their field."

"Need for business machines in our school commercial department."

"Too much training for regents--not enough in areas of more interest."

Summary

During September 1964 the high schools of the tri-county area mailed two thousand five hundred and eighty-nine questionnaires to those listed as ninth-grade students in 1958. This mailing was later followed by a letter to those who had not responded. Ultimately one thousand one hundred and forty-two useful questionnaires were returned. This is a return of forty-four percent.

It was learned that five hundred and sixty-six were in college and that five hundred seventy-six had discontinued school.

In the college group there was frequent mention of appreciation of high school teachers' efforts in their behalf and that they had enjoyed their high school life. However, some deplored their lack of reading ability and others expressed regret at not having acquired better habits of study while in high school.

About forty percent reported that they had failed one or more subjects while in high school.

In the selection of their major field of study, students appear to be following a traditional pattern with respect to foreign languages. However, one named Chinese and another Russian as his major field.

In the out-of-school group, a regret at not having made better use of the high school opportunity was mentioned frequently together with an often expressed, "I wish I were back".

Relatively few, one hundred and fifteen to one hundred and forty, are unemployed.

Of those employed two hundred and seventy-nine stated that they were satisfied with the work they are now doing.

About sixty-five percent of this out-of-school group failed one or more subjects while in high school.

"Bored with school work" was the reason most often given for leaving school. Difficulty with academic subjects was the next highest.

These young people state that they enjoy work most when it deals with people and things. Working with books was preferred by twenty-one of them.

Fifty-eight percent state that they learn most easily through shop and laboratory demonstrations.

This is obviously a small sample and further research is needed. Of the class of 1962, one thousand four hundred and forty-seven were not heard from. It would appear that the questionnaires returned represent the more-successful students.

What has been learned may provoke considerations of the need for new programs and teaching methods which should result in a more effective secondary education for these out-of-school youth.

SECTION VIII

MANPOWER NEEDS AND VIEWPOINTS OF EMPLOYERS

The information presented in this part of the survey includes data pertaining to the employment of each county's major occupational groups. Variations exist among the three counties. Since anticipated changes will not take place uniformly in all parts of the survey area, it is important to provide data on each county. To better understand the significance of the differences in the over-all employment picture, data is also provided on a national and state level to permit further comparisons.

The projected increase in population of the tri-county area infers that there will be a corresponding increase in employment. Before valid projections of future manpower needs may be made, it is necessary to know the present employment situation.

The material in this phase of the survey was obtained by: (1) Inquiry into the number of persons employed in the various occupations in the area; facts and figures were provided by several Federal and State sponsored sources. (2) Personal interviews were conducted with fifty-five key persons representing agriculture, business, industry, public institutions, labor and employers' organizations; and (3) An employers questionnaire was mailed to one thousand employers distributed throughout the tri-county area. Two hundred and twelve questionnaires were completed by the employers. The majority of returns included answers to all questions on the questionnaire.

Facts, Figures, and Opinions of Employers

Who Are Interested in Vocational-Technical Education

The survey sought to determine how employers recruited new help; what opinions they held in connection with vocational education; in what occupations they would consider hiring of vocational-technical high school graduates; the number of workers they now employ; and their estimate of the changes in their employment figures for the next three years.

Table 8.16 The Types of Business and Industrial Firms that Responded to the Questionnaire

Industry or Business	Columbia	Dutchess	Putnam	Total
Agriculture, Dairy, Fruit, Landscaping Floriculture	1	4	1	6

Employers' Responses to the Question: "How Do You Generally Hire New Employees?"

Items	Columbia	Dutchess	Putnam
At Gate	21	36	14
New York State Employment Service	20	39	3
Private Employment Agency	1	20	4
Union	--	6	2
Other Employees	18	63	18
Newspapers	9	24	7
Schools	2	6	5
Miscellaneous	4	22	1

Many of the employers answered the above question by indicating that they utilized a combination of several of the means mentioned. New York State Employment Service is well recognized in Columbia and Dutchess counties but is not considered as effective in Putnam County. As indicated by these employers, it does not appear that the schools are doing an adequate job in job placement in any of the counties. With the exception of employment of office personnel, no employer mentioned that he contacted the high schools when seeking new employees.

Employers' Responses to the Question: "Do You Favor the Idea of Expanding Programs in Vocational-Technical Education?"

A. For High School Students:

Answers	Columbia	Dutchess	Putnam	Total
Yes	46	112	26	184
No	0	4	2	6
Undecided	1	4	1	6

B. For Adults:

Answers	Columbia	Dutchess	Putnam	Total
Yes	37	106	23	166
No	0	4	3	7
Undecided	8	9	2	19

From the responses to this question, ninety-four percent of the employers who answered the questionaire indicated that they would like to see vocational-technical programs expanded for high school students, 86.5 percent of the same employers are also in favor of expanding (evening) vocational programs for adults.

Employers' Responses to the Question: "Could an Expanded Local Vocational-Technical Program Help to Meet Your Needs?"

Answer	Columbia	Dutchess	Putnam	Total
Yes	32	82	24	138
No	7	20	7	34
Undecided	11	23	0	34

Sixty-seven percent of the two hundred and six employers who answered this question answered it in the affirmative. About two-thirds of the employers indicated they can use people with the type of training that can be provided in a vocational-technical program.

Employers' Responses to the Question: "Would Your Firm Be Interested in a Cooperative Work Study Program?"

Answer	Columbia	Dutchess	Putnam	Total
Yes	27	54	14	95
No	15	52	13	80
Undecided	8	25	5	38

Forty-four and one-half percent of the employers indicated an interest in a cooperative work-study program. Of the 37.5 percent that answered in the negative, many said that their business was too small to take part in such a program but that they saw a need for it in the area.

"Write-in" Comments from the Employers' Questionnaire

A selection of comments submitted by employers includes the following statements:

"There are no schools in this area that teach my line of work. I would be interested in employing a student of a cooperative work-study program because good auto-body men are hard to find. It seems, working with your hands has become a past art."

"I am willing to contribute educational technical props and advice to a bonafide school program."

"A Vocational-Technical program should be one that calls upon interested employers to get together to advise the school authorities and assure the students of jobs."

"Vocational education is excellent and should be introduced in all school systems. It is unfortunate indeed that todays high school programs are designed mostly for those who intend to go to college and fall far short of educating those who wish to pursue work in the trades. In fact, the impression one receives is that unless a person is college educated in highly technical fields his future is a failure and he is considered an inferior person. This is intolerable, and I certainly feel that vocational training would help to change this attitude. It would also cut down on the percentage of school dropouts."

"At present there is not much being done along the line of training employees for the construction trades.---: There is need for an expansion of all types of trade programs."

"Teach a kid a trade and even if he should 'drop out', the little bit he did learn would make him more employable."

"All work requires skill, ability, interest, background and dependability. ---The untrained are almost useless to us."

"It is very evident that there is an abundance of unskilled labor. Vocational training is becoming more and more needed each year."

"A work-study program would be of great value."

"I Have to send much of our work to our plants in other sections of the country because I can't find trained machine shop help in this area."

"I need toolmakers. I have had no applicants for this job for the past two months."

"Many of the High-School dropouts who have come here looking for work will tell you that they have no experience. We have hired some of them.---. We are fed up with the inexperienced."

"I believe that there would be fewer dropouts if good vocational courses were offered in all high schools."

"Vocational training----, would raise the labor standards of the area."

"We have our own training program, but a school training program would help greatly."

"The Vocational-Technical courses must not be a dump for undisciplined and disinterested students. But any one willing to learn to work at some skilled occupation should be given an opportunity to learn it."

By an examination of Table 8.17, it can be seen that there are many occupations for which employers would be willing to hire trained high school graduates. Unfortunately, in some of these jobs there are few workers and therefore few opportunities for occupational entrance. Nevertheless, personnel for these occupations can be trained in either cooperative work-study programs or in evening extension programs for adults.

What is the Present Working Force and Projection for Future Employment?

Columbia County: The 45 employers that answered this question employ 1,975 workers. Employers estimated the following changes in their working force over 1964 in percent as follows:
1965---37 Employers estimated a 15.9% increase.
1966---31 Employers estimated a 24.5% increase.
1967---31 Employers estimated a 31.9% increase.

Dutchess County: The 121 employers that answered this question employ 16,376 workers. Employers estimated the following changes in their working force over 1964 in percent as follows:
1965---92 Employers estimated a 2.7% increase. *
1966---71 Employers estimated a 2.8% increase.
1967---63 Employers estimated a 4.0% increase.

Putnam County: The 26 employers that answered this question employ 908 workers. Employers estimated changes in their working force over 1964 in percent as follows:
1965---17 Employers estimated a 9.5% increase.
1966---16 Employers estimated a 20.5% increase.
1967---13 Employers estimated a 31.5% increase.

---

* Excluding a large corporation in Dutchess County that does not expect an increase in employment, a 31.8% increase is expected by the other employers in the county by 1965.

From the above estimated figures, it can be seen that if the employment projection of the large corporation in Dutchess County is excluded, the increase of the rest of the working force in each of the three counties will average out to slightly over 10% each year for the next three years.

The Growth of the Major Industries in the United States[1]

Between 1960 and 1970 it is estimated that employment will rise about twenty percent in the United States in total employment of workers.

---

1. Manpower, Challenge of the 1960's. U. S. Department of Labor.

The changing needs of industry in New York State will affect the employment of workers in the future. The skill requirements of individual industry groups will change as a result of advances in production and service methods. The table below gives a summary of some of the expected changes.

Table 8.18 Estimated Number of Jobs in New York State[1]

(In thousands)

Occupation	1957	1965	1970	Percent Change from 1957 to 1965	Percent Change from 1957 to 1970
Total	7,331	8,160	8,703	+11.3	+18.7
White-collar occupations	3,481	4,052	4,424	+16.4	+27.1
Professional, technical and kindred workers	816	1,044	1,184	+27.9	+45.1
Managers, officials and proprietors	792	881	948	+11.2	+19.7
Clerical and kindred workers	1,310	1,493	1,609	+14.0	+22.8
Sales workers	563	634	683	+12.6	+21.3
Manual occupations	2,668	2,810	2,913	+ 5.3	+ 9.2
Craftsmen, foremen and kindred workers	901	1,010	1,083	+12.1	+20.2
Operatives	1,446	1,498	1,541	+ 3.6	+ 6.6
Industrial laborers	321	302	289	- 5.9	-10.0
Service workers	987	1,123	1,206	+13.8	+22.2
Farmers, farm managers and farm laborers	195	175	160	-10.3	-17.9

The major changes in New York State between 1957 and 1970 are estimated to include a rapid growth in the number of white collar workers, a 20.2% growth in craftsmen and kindred workers, a 22.2% growth of service workers, and a considerable decline in numbers of laborers and people working on farms.

Summary

The tables of factual information in this section were based on materials obtained from the Business Fact Book and from the United States Census. This information will give the reader details of occupations and employment in each of the three counties. Much of this material was used by the survey team in formulating conclusions and recommendations which are included in Section IX of this study. These data will also be found useful by persons involved in planning curriculum and courses for area centers for vocational-technical education.

The total employment situation for the tri-county area shows a work-force of ninety one thousand, four hundred and forty-eight of which seventeen thousand,seven hundred and seventy-five work in Columbia County; sixty one thousand, eight hundred and fifty-one work in Dutchess County; and eleven thousand, eight hundred and twenty-two are employed in Putnam County. Many people, living in the survey area, commute to work outside their county of residence. This fact should be taken into consideration when planning programs of training for entering employment.

The information obtained from a questionnaire indicates that ninety-four percent of the employers in the survey area were convinced of a need for expanding vocational-technical programs for high school students. Eighty-seven percent of these employers indicated a need for vocational-technical training and extension courses in the evening for employed adults.

The pattern of Agriculture in the survey area follows a national trend of decreasing employment on the farms. It is probable that needs for agriculture education will remain static during the next few years with the current trend of expanding the curriculum to include such industries related to agriculture as food processing, farm machinery, and other related areas. Nationally, it is expected that employment of non-skilled labor will continue to decrease in the future. However, most of the other occupations are expected to increase. This is especially true in the areas of "services", "trades" and "construction". Employers in the survey area reported probable increases in employment at a rate of ten percent per year in the next few years.

Although large increases in population are anticipated in projections by the Census Bureau, there are many occupational areas which are not large enough to justify unit vocational courses in an area center. High schools throughout the State of New York service these smaller occupational areas with employees by means of cooperative work-study programs. Forty-five percent of the employers indicated an interest in cooperative education programs as a means of training new employees. On the same questionnaire, many additional employers indicated that they, themselves, could not take part in a cooperative program, but they were in favor of this type of occupational training.

SECTION IX

CONCLUSIONS AND RECOMMENDATIONS

Based upon the facts gathered and included in detail in other sections of this survey, there are several questions which have arisen concerning the future of vocational-technical education in the survey area. The survey team has stated these questions and then answered them with their recommendations which are based upon a review of the facts as reported. In this section, suggestions for the location of three area vocational-technical centers are included together with suggested programs and courses to be considered in each of the three centers. This section of the survey also includes some guidelines for the implementation of a three-county area vocational-technical program through the services of the same committee structure which made this survey possible.

This Survey which combined the three-county area of Columbia, Dutchess, and Putnam Counties was structured in this way for the convenience of making the survey. In Implementing the recommendations of this survey, consideration should be made of other similar studies which will be available for counties adjacent to this area and also the nearby counties on the western shore of the Hudson River. Each of the area centers which have been recommended in this report should be phased into the entire State plan for vocational-technical education on an area basis regardless of county or study-area boundaries.

Is there need for area vocational-technical education centers?

Nationally there are now more than one million young men and women under twenty-two who have left school and are not at work. At any given time thirty percent of the high school dropouts will be unemployed. High School graduates average fifteen percent unemployed.[1] The alarming incidence of delinquency and crime among jobless youth is well documented.[2] It is almost the unanimous opinion of school administrators, employers, and parents who were contacted by the survey team, that the schools should provide more vocational, technical, and occupational training for the youth who will be eligible to enter the labor market at the completion of their high school education. Many felt that an area vocational-technical program will make high school education more meaningful to potential dropouts and thus give them an incentive to finish their high school education.

Rural youth who seek to earn their living on the farm, in the city, or in urban communities have long been deprived of the opportunities offered through vocational education programs. Area vocational centers located near the centers of large population concentrations will permit the expansion of the number and variety of specialized vocational-technical courses available to all secondary students and adults in the tri-county area.

The results of this survey of student's occupational interests; parent's viewpoints toward expansion of vocational-technical education on the secondary-school level; and employer's reactions to occupational training indicate an unquestionable need for an area program for vocational-technical and occupational training for students who expect to enter employment upon graduation from high school.

Will transportation pose a major problem in the establishment of area centers which will serve all youth?

The location of the proposed centers for vocational-technical education is within a maximum radius of twenty miles of all the school districts of the area which each center is proposed to serve. It is recommended that each center be located near a major highway outside city limits in order to make the center readily accessible for transportation by bus-from the home school districts. There is no doubt that transportation will present some problems which may be resolved by establishing transfer centers where smaller groups of students may be bussed part way to the area center and then transferred to another bus for the balance of the trip. At present, some students attending a BOCES center for trade courses are transported entirely across (west to east) Putnam County for one-half of the school day and return to their home school for required courses of the other half of the day.

1. Venn, Grant, Man, Education and Work. Washington, D.C.: American Council on Education, 1964.
2. President's Committee on Youth Employment, The Challenge of Jobless Youth. Washington, D.C.: Government Printing Office, 1963.

Will the vocational-technical student be handicapped by being separated from his home school and classmates who pursue programs of an academic nature?

The proposed plan does not separate the student from his home school. By using the vocational-technical facility for courses of a specialized nature, the student will return to his home school for half of the school day and will therefore be able to participate with his class in extra-curricular activities. A well planned area center of this type will make it possible to accommodate approximately twice the number of students on a half-day basis.

Would it be feasible to use existing school buildings or add to present facilities to provide space for an area center for vocational-technical education?

Almost every school in the survey area is growing and will need all of the available space it can get within the next decade. Each of the counties is growing rapidly in population. An area center located in a new building away from any of the present local school district buildings will reduce some of the over-crowding anticipated in the near future. The highly-specialized character of vocational-technical education requires a special building designed to meet the special needs and to house the necessary equipment. One reason for the difficulties experienced by many vocational programs of a generation ago was the lack of adequate building facilities and equipment for the establishment of a quality program.

Should an area center for vocational-technical education be available to all youth?

The majority of school administrators in the survey area felt that an area center should serve not only the average high school student but should have programs geared to the needs of those who find difficulty in learning traditional academic subjects as well as those of the more-gifted youth whose interests may be in the technical subjects. Selection of students for admission to an area vocational-technical center will be the responsibility of a competent guidance staff in the home school districts. Provision must be made for coordinating the guidance programs in all of the schools within the area center. This coordination will necessitate a chief guidance director for each area center.

Would an area vocational-technical center duplicate the function of the existing programs of the Dutchess Community College?

Programs of study in the Dutchess Community College do not emphasize occupational skills of a manual nature. The practical courses in this two-year college emphasize the technologies on a post-high school level. Dutchess Community College and the proposed area centers could work cooperatively in the areas of vocational-technical education. Programs on the collegiate level could complement the area programs on the secondary level.

Would students attending the proposed area centers for vocational-technical education be eliminated from college entrance on the basis of their specialization in a vocational or technical curriculum?

Although the main purpose of establishing the area centers for vocational-technical education is to provide occupational training for those who will be available for employment when they graduate from high school, attendance in an area vocational-technical center could add to the qualifications of students planning to enter community colleges, technical institutes, or even engineering colleges. A course in metals or electronics technology would be an excellent experience for a student anticipating entering a mechanical engineering curriculum. Drafting, printing, commercial art, and all phases of technology on the secondary level would provide good background for continuing education on the collegiate level.

What vocational courses might serve those on the lower end of the educational scale?

Area vocational centers should serve those on the lower end of the educational scale with special occupational courses many of which fall into the general category of semi-skilled occupations. In addition to courses needed for a general high school diploma, the area center could provide the less-gifted students with an opportunity to acquire the necessary skills to enter employment.

How will the proposed area vocational-technical centers serve the needs of the unemployed?

The area vocational-technical centers should have programs for occupational retraining for those who have been unemployed because of the shift in manpower needs due to automation and other technological developments. Special programs should also be considered to train those young adults who have dropped out of high school without receiving occupational training and are unemployed or need training for a better job.

How can training be given to students in occupations which require only a few workers and correspondingly only a small number need training?

There is a great need for more industrial-cooperative programs for the training of high school students through a supervised work-experience program. Many of the employers in the survey area indicated an interest in a program of cooperative supervised work experience. In schools where such programs have been established, there has been a noticeable decline in the drop-out rate. It is recommended that any plans for an area vocational-technical center include provision for supervised work experience for the occupations which can best be serviced by this program.

Should business education courses be taught in the home high schools as at present?

The survey team recommends that the business education courses which are now offered in the home schools be continued. It is possible that, with a larger variety of vocational courses available from which the student may choose, more care may be taken in the selection of students for entrance into the vocational business curriculum. Some advanced courses in vocational business education might be offered in area centers for the use of home schools in which enrollments would not be large enough to justify such offerings.

What about vocational homemaking?

It is recommended that homemaking education be retained in the home schools which now have these programs. There is an expressed need for occupational courses in child care, and in textile fabrication. These vocational areas of homemaking education can best be served through the facilities of an area center.

Is there a need for more emphasis on agriculture education?

With declining employment on the farms there has been a corresponding decrease in enrollment in vocational agriculture. Several schools which had agriculture programs in the past have given up the programs entirely or, in some cases, they have joined with other school districts in an agriculture education program offered by the BOCES in District One of Columbia County. In the opinion of the survey team, it would be more economical to include an agriculture education program in one or two of the area centers and make this phase of vocational educational available to as many secondary students as could benefit by such a program. In addition to the courses presently taught, there is an indicated need for courses in landscaping and horticulture.

How will an area vocational-technical program effect the industrial arts program in the home high schools?

The industrial arts program will continue to serve the needs of secondary school students in the home schools. The increasing importance of our modern industrial society makes industrial arts a very important subject area in the general education of all youth. It is recommended that the present industrial arts program emphasize the pre-vocational objective, especially in the ninth grade. This should enable a student to more intelligently choose a program of trade or industrial education offered in the area center.

How will schools which are presently offering courses in vocational education cooperate with the new area centers?

Existing programs in trade, industrial, and technical education should transfer their courses and programs to the proposed area centers. The new area centers will need the services of the experienced teachers and administrators who are familiar with the operation of a vocational program in the organization of the new area centers. Equipment which is now being used and which is not obsolete should be transferred to the area center to augment the new equipment which will be necessary for an effective program.

Area Vocational-Technical Centers

In order to provide needed vocational-technical programs for the school districts which are located in the sparsely populated areas of our state, it is proposed that area centers be established which will serve several school districts. The advantages of a few large centers for vocational-technical education as opposed to many smaller local programs is that of economy and efficiency. Each of the three centers proposed by the survey team will serve a cluster of school districts which have been selected after taking into consideration high school enrollments in grades ten through twelve in the local schools and also the geographical location of the high school districts. Since transportation is seen to be a major problem, the proposed centers have been located near major highways to keep transportation time to a minimum. County lines were not considered as a factor in arriving at the location of the centers although each of the proposed centers serve a major portion of the school districts in their respective counties.

COLUMBIA CENTER

The proposed area center near the City of Hudson should be located somewhere off Route 66 between Hudson and Chatham. A location about five miles north-east of Hudson would place the center encompassing New Lebanon and Tivoli within a twenty mile radius. The Columbia Center would serve districts with a gross enrollment of 2,421 in grades ten through twelve.

DUTCHESS CENTER

It is proposed that an area center be located off Route 44, about five miles north-east of the City of Poughkeepsie. An eighteen mile radius from this point on the map would encircle almost the entire area of Dutchess County. The City of Beacon and the town of Pawling have not been recommended for this center since the completion of Interstate Highway 84 will make an excellent route from Beacon to the Carmel Center. Pawling is also nearer to the Carmel Center with good direct transportation on Route 22. The Dutchess Center includes districts with a gross enrollment of 6,581 students in grades ten through twelve.

PUTNAM CENTER

A third area center is proposed to serve the area of southern Dutchess County and the school districts in Putnam County. The proposed location of the Putnam Center is somewhere near Route 6 in or near the town of Carmel. This location would place all of the school districts served by the center within an eighteen mile radius. This center for vocational-technical education would serve districts with a gross enrollment of 2,521 students in grades ten through twelve. In planning programs and facilities for the Putnam Center, an investigation of the plans for area vocational-technical centers in northern Westchester should be kept in mind. It is possible that the Putnam Center could also serve communities in northeastern Westchester County.

Programming

Secondary school programs in trade and technical education require an instruction period of three hours per day in a shop or laboratory for each school day. Programs are generally for two or three school years although preparation in some occupations might be covered in a shorter period of time. It is the opinion of the survey team that the present offerings in homemaking, business education, distributive education, could be best conducted in the high schools in the local districts. It is possible that some advanced and special courses in the above-mentioned fields of vocational education will require the facilities of the area center in order to conduct courses efficiently and economically.

PROPOSED LOCATION OF AREA CENTERS

It is recommended that the proposed area centers should also serve young adults who need occupational training in a post-high school program. These centers will also provide facilities for adults to extend their occupational competency in evening courses. Labor organizations may also be interested in using the area centers for trade apprenticeship classes.

There are two possible plans for programming students who attend area vocational schools. One plan calls for the students to be transported from their home to the area center and to provide a complete high school program including shop and related courses at the center. A second plan is based on the opinion of many educators who feel that it is very important not to segregate the vocational and technical students from their classmates in their home school. They recommend that students attending area vocational-technical centers, spend one half of the school day at the area center taking the shop or laboratory courses, and the other half of the school day at their home school. At their home school, the students would study the academic and related subjects required for graduation from their home school and would also be available to participate in extra-curricular activities with the classmates they have known throughout their schooling.

Pawling	219
Putnam Valley	167
Total	2521

Selection of Courses

A listing of possible courses for consideration in each of the three area vocational centers has been formulated after consideration of the expressed interests and needs of tenth and twelfth grade students, the interests and needs of their parents, the expressed interests and needs of young adults, and also manpower needs as indicated in Section VIII of this survey.

The first step in formulating this list was to tabulate the courses most frequently mentioned by those who participated in the survey. Separate tabulations were made for each county in order to aid in course planning for each center.

Manpower needs were determined by selecting occupational areas which are most likely to absorb the trained persons within the entire tri-county area. The list of manpower needs was tabulated after considering national trends in employment; employment conditions in the survey area; and expressed needs of employers. Current trends indicate that employment opportunities for a beginning employee often are located outside the county in which he is trained. In organizing courses to be included in an area center, consideration should be given to occupational opportunities in a larger region than that of the boundaries of this study. Trends which indicate potential growth of the use of automated equipment will require consideration of new jobs and skills for beginning employees.

Recommendations for the Implementation of the Study

Based upon the findings reported in other sections, and the conclusions which have been drawn from these findings, the following recommendations are made for the implementation of an area program for vocational-technical education to serve this tri-county area. There is much that lies ahead before the impact of an area program will have its effect on students for which it is designed. It is therefore absolutely essential for those in whom the leadership and authority has been entrusted to act with dispatch upon these recommendations. All phases of this survey indicate a mandate to the educational, business, professional, industrial, and lay leaders of this three-county community to provide the needed vocational, occupational, and technical training for those students who can benefit by these programs.

1. The first step involves the agreement of the executive committee upon attendance areas to be served by each of the centers. The attendance areas which have been suggested are recommended after careful analysis of all factors concerned. It is reasonable to assume that some minor revisions will be made in locations on the fringe of an area center. Districts located in these areas might conceivably participate in each of two centers and thus take advantage of a greater range of vocational choice in the program available to the student. City or county lines should not be considered a restriction. The most economical approach to planning area centers requires establishing them in such a location that they will serve a tenth-to-twelfth grade base for more than two thousand students.

2. Appoint a Director of Vocational Education who will assist the executive committee and the boards of education in each of the three area centers in preliminary plans for buildings, equipment, courses and staffing.

3. Plan a vocational-technical program for each area center using the suggested course listings on page 140 and also by referring to other sections of the survey as a guide. The Executive and Policy Committee should appoint three curriculum subcommittees, one for each area center. These committees, made up of members of the Advisory Committee and Planning-Action Committee, should be charged with determining the courses to be offered in each of the centers. These course offerings should then be further screened by members of the Executive Committee to coordinate the offerings in each of the three areas. Consultation with members of the staff of the Division of Vocational Education, State Education Department should be made before final course plans are formulated.

4. Determine site locations.

5. Make preliminary plans regarding the teaching staff and administrative personnel necessary for establishing each center.

6. Consider the possibility of improving existing programs in local district schools which have a direct relationship to vocational-technical education. Some courses would not require new facilities and could be offered in the medium size high schools. Vocational agriculture might best be taught in local schools in the eastern part of Dutchess and Columbia Counties by consolidating present programs in three or four central locations and making these courses available to schools which cannot justify the program alone. Vocational distributive education, vocational business education, and work experience programs could all be offered at a reasonable cost in existing facilities. Basic academic subjects especially designed to meet vocational and occupational needs could be taught in the traditional classroom in the home school.

7. Strengthen the existing subject areas which will feed students into an area vocational or technical program. The pre-vocational aspects of industrial arts, basic homemaking, and beginning business education courses could aid potential vocational and technical students in their selection of occupational areas of interest.

8. Strengthen the guidance services in the local schools by providing greater emphasis on vocational guidance. Consider having a guidance director on the staff of each area center for the purpose of coordinating the selection practices in each of the participating high schools and also to establish placement services for the graduates of vocational programs.

9. Consult with the State Education Department, Division of Vocational Education for assistance in financial planning and for the latest information about funds available from federal and state sources for building, equipping, and staffing area vocational schools.

*VOCATIONAL EDUCATION; *MASTER PLANS; *EDUCATIONAL IMPROVEMENT; ADVISORY COMMITTEES; *OCCUPATIONAL GUIDANCE; *PROGRAM PLANNING; PUBLIC RELATIONS
SAN JOAQUIN COUNTY; CALIFORNIA

The objective of this second phase of a three-phase project was to implement recommendations of Phase I by organizing a working unit and determining county feeling about a vocational education program and how best to organize, administer and finance such a program. Developments were (1) The county superintendent of schools assumed leadership of the implementation plan, (2) Advisory and implementation committees were appointed, (3) Results of the study and the organizational plans were publicized by means of a community symposium and by use of news media, (4) Several new programs centered on occupational areas were developed at an interdisciplinary curriculum development workshop for 54 teachers, (5) Guidance and counseling personnel developed a booklet for evaluating the occupational programs, (6) A first draft of a master plan for occupational education and its support was presented to the advisory and implementation committees, and (7) Proposals for the funding of programs in relation to the project were advanced. Phase I and II accomplished the structuring of a framework for establishing a vocational education program in the county. A second conference will prepare for the last phase of the project. (SL)

F O R E W O R D

This is the final report of Phase II of the San Joaquin County Vocational Education Project. It is comparable to the final report for Phase I, Strengthening Vocational Education in San Joaquin County.

As outlined in this report, this second or implementation phase has been subdivided into two parts: planning for implementation, and implementation itself.

Planning for implementation has now been essentailly completed, and implementation proper will begin with the convening of the second Powerhouse Action Conference on October 7-8, 1966.

It is with a sense of achievement that this report is submitted. The prospects for an ambitious, innovative program in San Joaquin County appear excellent.

I introduction

Section I

INTRODUCTION

The scope, complexity, and urgency of the task being undertaken in San Joaquin County through the Vocational Education Project can be admirably summed up by use of an excerpt from a report of the National Commission on Technology, Automation, and Economic Progress. Speaking of the American economy as a whole, it said:

> Unemployment has been concentrated among those with little education or skill, while employment has been rising most rapidly in those occupations generally considered to be the most skilled and to require the most education. This conjunction raises the question whether technological progress may induce a demand for very skilled and highly educated people in numbers our society cannot yet provide, while at the same time leaving stranded many of the unskilled and poorly educated with no future opportunities for employment. . . . If the relative disadvantages of the unskilled and uneducated have increased in recent years, the main reason is that the economy is more, not less, likely to run out of skilled and educated men and women. . . . The individual's education and skill are important determinants of his relative ability to compete for jobs. The education and skill of the labor force is important to the economy's viability. . . . Together education, skill, and technology, along with other factors, determine the structure of employment and unemployment.[1/]

It was with these crucial realities fixed firmly in mind that the San Joaquin County Vocational Education Project was instituted in 1964. Under the leadership of Dr. Gaylord A. Nelson, County Superintendent of Schools, a series of community meetings was held to discuss vocational education in San Joaquin County. Support for the study from educators and from other citizens as well was immediate. A countywide Vocational Education Project Committee was established, chaired by Joseph Acosta, Vocational Education Coordinator in the county superintendent's office. Ultimately, a proposal outlining and requesting financial support for

---

1/ Technology and the American Economy: Report of the National Commission on Technology, Automation, and Economic Progress. February 1966.

the project was submitted to the State Department of Education and was funded. The objectives of the project and of the Phase I study report, as outlined in the original proposal, are reproduced below for convenient reference.

Objectives of the Project

The proposal submitted to the State Department of Education divided the project into three phases: Phase I - The Survey; Phase II - Implementation; Phase III - Follow-up. The objectives for the project are as follows:

1. Modify existing high school and junior college curricula to provide pre-vocational and vocational training for students who are not expected to go on to a baccalaureate program.
2. Offer those high school students who might generally be expected to drop out of school an opportunity to motivate themselves by providing them with training which will be of value to them in seeking vocational opportunities.
3. Provide all students with better preparation for fulfilling their vocational goals by making available to them training opportunities which are not now available.
4. Relate the needs of prospective employers to the educational program to insure a curriculum which has specific and practical value to each student.
5. Determine the types of programs needed in San Joaquin County.
6. Provide informational services to students to assist them in making realistic vocational choices and to counselors to aid them in providing realistic vocational counseling services.

Objectives of Phase I - The Survey

The study, Strengthening Vocational Education in San Joaquin County, represented Phase I of the Project. Its objectives were:

1. To examine present and future occupational opportunities and needs in San Joaquin County.
2. To inventory existing vocational education programs and facilities.
3. To assess the attitudes and opinions toward vocational education of students, counselors, educational administrators, and employers.
4. To recommend a program for strengthening vocational education in San Joaquin County.

Objective of Phase II - The Implementation

The objective of Phase II, referred to as the Implementation Phase, was to act upon the proposed plan of action recommended by the survey report produced during Phase I of the project. The plan proposed, however, was so comprehensive and necessarily complex (involving, as it does, so many different leaders, agencies, and jurisdictions) that Phase II had to be divided into two parts: a) planning and organization; and b) practical action in the districts. In effect, the practical objective of this second year of the project was to perform planning for actual implementation.

Method of Approach

The method of approach used in Phase II varied with the task. It is, therefore, discussed as part of the appropriate section in the body of this report.

Staff

Inevitably, in planning for implementation, many different groups and individuals within and outside of San Joaquin County were constructively involved in Phase II activities. Dr. George W. Ebey, president

of Pacific Research Center, Inc. (successor to George Ebey Associates, consultant to Phase I of the project), continued as principal consultant to the project. He was assisted by Max R. Tadlock, PRC vice president, and by David C. Miller of the PRC staff.

Definitive assistance was provided by the Center for Technological Education, San Francisco State College, under the leadership of Dr. George Champion, director. Center for Technological Education participants included Anthony Maniscalco, assistant director; Professor Robert Craig, San Francisco State College; Dr. Robert Weisgarber, director of the audio-visual center, San Francisco State College; and Winston Howe, head of the industrial arts department, De Anza High School, Richmond.

Professor H. Bonner McDaniel of Stanford University, a nationally known authority on educational counseling, gave substantial aid in conducting counselor workshops.

Joseph Acosta, County Vocational Education Coordinator, continued in the crucial coordinating role of chairmain of the Implementation Committee and executive secretary of the County-wide Advisory Committee, in addition to his many other activities reported subsequently. The members of the Implementation and Advisory committees also made important contributions to the project. Special mention should be made of the time and effort expended by Eric Biedermann, Best Fertilizer Company, in his role as chairman of the County-wide Advisory Committee.

Special mention must also be made of the separate but vitally related County Office of Education project headed by Leonard Beeman, of the county office, and Donald E. Cerqui, Diamond Walnut Growers, Inc., who, as co-directors, organized and administered the highly successful First San Joaquin County Occupational Guidance Center in March 1966. Mrs. Yvonne Blackmun should also be commended for the untiring work and time given as coordinator of the center and in other activities.

As in the past, the project enjoyed the enthusiastic and vigorous support of Dr. Gaylord A. Nelson, County Superintendent of Schools. He was assisted in his direction and supervision of the project by J. Hamilton Hodgson, County Associate Superintendent; and A. Neil Hafley, County Assistant Superintendent.

Acknowledgements

Appreciation is expressed to the scores of citizens throughout the county who participate in the Advisory and Implementation committees, who assisted in the spring symposium, who played an important role in the Occupational Guidance Center, and who in general, through their actions and support, have provided the principal momentum for Phase II of the project.

Dr. Julio L. Bortolazzo, president of College of San Mateo and former president of San Joaquin Delta College, made a dynamic summing up of Phase II in his concluding remarks at the spring symposium, and his gracious assistance is gratefully acknowledged.

Special acknowledgement is also extended to Wesley P. Smith, State Director of Vocational Education, for his continuing support of the project and for his participation in the spring symposium.

Particular appreciation is given to the Center for Technological Education, San Francisco State College, whose services were made available without charge to the project. (CTE is supported jointly by San Francisco State College and a major Ford Foundation grant.)

II summary of action

SECTION II

SUMMARY OF ACTION

During the course of Phase II: Planning and organizing for implementation, conducted in the 1965-66 school year, much has been achieved. Much remains to be done, for in a new comprehensive program, involving many cooperative relationships, implementation and the planning for it are complex. Following is a summary of the year's developments and accomplishments.

1. An action planning meeting was recommended by the Vocational Education Project Committee upon its acceptance of the Phase I survey report. The meeting, now known as the Powerhouse Action Conference, was convened October 29, 1965 by County Superintendent of Schools Gaylord A. Nelson at the PG&E Powerhouse on Tiger Creek. Attending with the VEP Committee members were the superintendent and president, a member of the board of trustees (or their respective designate) of each San Joaquin County high school district and San Joaquin Delta College, as well as representatives of the County Superintendent of Schools Office, San Francisco State College Center for Technological Education, and Pacific Research Center, Inc.

2. Organization for implementation and communication to the community of the study findings were marked as of prime importance by the Powerhouse Action Conference participants, in their concurrence with the recommended plan of action of the survey report. It was agreed that the logical agency to assume the leadership role was the County Superintendent of Schools Office.

3. An Implementation Committee was appointed by the county superintendent. It included the county superintendent of schools, the president of San Joaquin Delta College, and the district superintendents of each high school district

in the county, the manager of the Stockton State Department of Employment office, the county vocational education coordinator, and representatives from the State Department of Vocational Education, the Center for Technological Education, and Pacific Research Center, Inc.

4. Acting upon suggestions from the Implementation Committee, the county superintendent appointed an Advisory Committee consisting of persons representing business and industry, labor, government, the professions, students, and education-oriented civic organizations. The Advisory Committee, as well as the Implementation Committee, has held a series of productive meetings during the year.

5. Intensive efforts were made to publicize the results of the study and the organizational plans. Media used were speeches, newspapers, a summarizing pamphlet, radio, television, and a sound motion picture.

6. An interdisciplinary curriculum development workshop, organized by the Center for Technological Education, was given in Stockton for academic credit at San Francisco State College. A total of 54 teachers enrolled, representing seven high schools and a senior elementary school. As a result, several new programs centered on occupational areas will be inaugurated this fall.

7. An occupational guidance booklet and checklist was developed for evaluating these programs throughout the county. This checklist was prepared by a committee of counseling and guidance personnel from San Joaquin County high school districts and San Joaquin Delta College, and by representatives from the Center for Technological Education and Pacific Research Center, Inc. Coordination and leadership were provided by the County Superintendent of Schools Office and a project consultant from Stanford University. After a trial in the county, the checklist will be published for wider distribution.

8. A master plan for occupational education was drafted and deliberated in detail by the Implementation and Advisory committees. The second draft will be presented for consideration at the second Powerhouse Action Conference to be held October 7-8, 1966. A portion of the plan relates to the countywide tax for a regional occupational center made possible by state legislation, as discussed at several meetings of the Implementation Committee.

9. A community symposium was held in May at San Joaquin Delta College to recount the progress on the project and to exchange views on future directions. Key speakers were Wesley P. Smith, State Director of Vocational Education, and Dr. Julio L. Bortolazzo, president, College of San Mateo.

10. Proposals for the funding of programs in relation to the project were prepared and are in process. A proposal for funds to continue implementing activity has been approved by the State Department of Education.

A sound start has been made on this significant program which has attracted attention and comment both inside and outside the county. The organizational mechanisms have been developed, the cooperative working relationships established, and the master plan for a countywide vocational education program drafted for approval early in the coming school year.

III background information: the phase I survey report

SECTION III

BACKGROUND INFORMATION: THE PHASE I SURVEY REPORT

A resume of Phase I activities in pursuit of its objectives is given briefly for convenient reference. The objectives were:

1. To examine present and future occupational opportunities and needs in San Joaquin County;
2. To inventory existing vocational education programs and facilities;
3. To assess the attitudes and opinions toward vocational education of students, counselors, educational administrators, and employers; and
4. To recommend a program for strengthening vocational education in San Joaquin County.

Conduct of the Study

The study was conducted as follows: An extensive literature search was made, resulting in the creation of a special reference library. Activities in the field were closely and continuously coordinated with the Vocational Education Project Committee through its chairman, Joseph Acosta. Numerous meetings were held with the VEP Committee as a whole and with individual members to obtain their suggestions, guidance, and information.

The VEP Committee organized separate subcommittees in the areas of agriculture, business, distribution, industry, and services for the purpose of providing additional input and guidance for the study. Interviews were conducted at every high school in the county and in the Stockton Unified School District with directors of guidance, consultants in business education and homemaking education, and assistant superintendents. The most recent high school accreditation reports were also reviewed.

The president and other key personnel at San Joaquin Delta College were interviewed in depth, and their responses were supplemented by the college's current accreditation report and by other documents. Special, carefully constructed questionnaires were distributed to all senior high school and junior college counselors and separate questionnaires were given to all public high school seniors and Schneider Vocational School students, and to technical-vocational education students at San Joaquin Delta College; the percentage of return from both sets of questionnaires was high.

Finally, more than 100 persons were interviewed throughout the county, representing employers, employer associations, labor unions, and other organizations knowledgeable about the local labor market. The result of all these efforts provided the raw information used in formulating the final study report.

Findings of the Study

An abstract of Section II of the final study report, "Summary, Conclusions, and Proposed Plan of Action," is given below:

Counselors, educational administrators, and employer representatives were agreed that the county's vocational education program should be substantially enlarged and improved. It was established that the county's economy exhibited a high and persistent rate of unemployment, relatively low income levels, and a tendency for young males entering the labor force to leave the county in search of work.

As for employment trends by industry, agricultural employment was found to be in a steady decline, although this was offset by some recent expansion of employment in manufacturing, and by a spurt, possibly temporary, in contract construction. The economy was found to be in transition to a service economy, but automation was seen to be making significant inroads in employment in this field.

As for occupational trends, the information available at the time of the survey was inadequate in terms of both extent and currency. Such data as were available (principally the 1960 Census) verified that:

-- Service industry employment gains exceeded other fields slightly.

-- Employment in sales occupations was only some 7 percent of the work force.

-- Clerical and related occupations were increasing at an extremely rapid rate.

-- Professional and technical occupation opportunities had doubled between 1950 and 1960 but were still at the very low level of fewer than 3 percent.

-- Skilled trade and craft opportunities were increasing but at a very low rate, and with actual declines in certain fields.

-- Jobs for equipment operators increased at a better than average rate during 1950-1960, but some unemployment was experienced near the end of the decade.

-- Jobs in agriculture and related industries were sharply in decline.

Upon assessing the status of vocational education in the county, it was established that all county high schools offered some vocational education but were comprehensive, with the exception of Schneider Vocational School in Stockton. Programs for adult and continuing education were found to be limited in number and in scope. It was determined that the largest single source of vocational education in the county was San Joaquin Delta College. A fundamental lack of coordination and articulation of vocational education programs among the various institutions and between the various levels was clearly revealed by the study.

A Proposed Plan of Action

Having established the status of the matter, the consultant submitted a proposed plan of action, incorporating the following elements:

1. Appointment of a countywide vocational education coordinating and steering committee composed of representatives from each high school and unified district, San Joaquin Delta College, the State Department of Employment, and the County Superintendent of Schools Office.

2. Development of a master plan (embracing participation by organizations within the schools and within the community at large) to establish specific goals and objectives, and to organize, execute, and evaluate suitable programs; designation of "master vocational counselors" at each school, with a strengthened counseling leadership role by the county superintendent; planning of non-credit courses and short courses in pertinent occupational areas; continuing collection and analysis of occupational information in order to develop suitable programs.

3. Designation of facilities and equipment required to provide both an immediate and a long-range vocational education program suited to the needs of the county.

4. Recommendations for immediate action by local districts, including such matters as establishing closer liaison with local employers; creating or expanding work-experience programs; making greater use of community resources; developing pre-technology programs articulated with San Joaquin Delta College offerings; updating knowledge of counseling and guidance personnel; improving the image of vocational education; planning for use of funds under the Vocational Education Act of 1963; exploring interdistrict agreements for specific programs; studying methods for improving continuing education; and participation in countywide activities such as workshops and career days.

These, then, were the highlights of the study report which constituted the principal result of Phase I of the project.

IV planning for implementation

Phase II began with the Powerhouse Action Conference

SECTION IV

PLANNING FOR IMPLEMENTATION

Introduction

This year was devoted to careful, intensive organization followed by a vigorous effort to determine the feeling of the county community about a vocational education program and how best to organize, administer, and finance such a program. As the balance of this report will indicate, these objectives were substantially achieved.

The Powerhouse Action Conference

Phase II of the project essentially began October 29, 1965. On that day, a meeting of the Vocational Education Project Committee (called by County Superintendent Gaylord A. Nelson) was held at the PG&E Powerhouse on Tiger Creek. In attendance were 25 persons, district superintendents and boards of trustees members representing each of the county's high school districts and San Joaquin Delta College, the County Superintendent of Schools Office, the Stockton office of the California State Department of Employment, the Center for Technological Education (San Francisco State College), and Pacific Research Center, Inc. (project consultant as corporate successor to George Ebey Associates). A complete roster of attendance at the Powerhouse Action Conference appears as Appendix A of this report.

Opening the conference, Dr. George Ebey, president, Pacific Research Center, Inc., made an extensive presentation of the methodology and findings in the Phase I study report, Strengthening Vocational Education in San Joaquin County. (A summary appears as Section III of the present report.) Having completed his presentation, Dr. Ebey charged the conference with reviewing the report for the purpose of further developing the proposed plan of action, keeping in mind pertinent legislation and developments which might have occurred after the report had been drafted. The conference was thereupon divided into four study groups, chaired

respectively by Wilbur B. Salmon, San Joaquin Delta College; C. C. Wirtz, Lodi Union High School District; Arthur Becker, Stockton Unified School District; and Dr. George Champion, Center for Technological Education.

Findings of the Powerhouse Action Conference

Details of the several group study reports may be found in the minutes of the Powerhouse Action Conference. Major points emerged which defined the central issues of the year's activities. These were:

-- An assertion that central planning and direction is essential, combined with the suggestion that the county superintendent of schools is the most obvious source of leadership.

-- An urgent awareness of the importance of counseling in vocational education, and of the general inadequacy of existing counseling programs.

-- A pronounced uncertainty as to the precise pattern of organization to be pursued, means for financing the program, and determining the nature and geographic distribution of the curriculums to be offered.

Recommendations of the PAC

In general, the VEP Committee enthusiastically endorsed the study findings, and made the following major recommendations:

1. that the VEP Committee be reconstituted as the Implementation Committee recommended in the study report, but now to consist of all district superintendents in the county, including the junior college district; Joseph Acosta, representing the county superintendent's office; a representative from the Center for Technological Education; and a representative from the project consultant, Pacific Research Center, Inc. Further, it was recommended that this committee be chaired by Mr. Acosta.

2. that the Advisory Committee recommended in the study report also be appointed, to consist of representatives from business and industry, labor, government, the professions, and education-oriented civic organizations. Further, it was recommended that

Mr. Acosta be named secretary of this group in order to maintain adequate communication and coordination between the two committees. (The Powerhouse Action Conference foresaw that direct responsibility for organizing the new vocational education program would reside in the Implementation Committee, while the Advisory Committee would represent the sense of the county community before the Implementation Committee. In practice, this has proved to be the case, with the Implementation Committee posing a continuing series of questions to the Advisory Committee; that committee considers these at length and gives the product of its deliberations to the Implementation Committee.)

3. that the offer of the Center for Technological Education to assist in defining and planning new curriculums be accepted.

In retrospect, the Powerhouse Action Conference is regarded as a watershed in the history of the project because it afforded formal community recognition of the dimensions of the vocational education problem in the county, as well as a commitment by the community to respond comprehensively to the challenges which that problem represents.

Community Communication Efforts

Throughout this project, it has been recognized by all parties concerned that comprehension by and active support of the community is essential to success. It was to achieve this community understanding and involvement that the VEP Committee was organized. It was to the same end that the Powerhouse Action Conference was held as Phase II of the project was inaugurated.

Immediately following that conference, it was acknowledged that the findings of the study report and the recommendations of the Powerhouse Action Conference must be conveyed to the community. A successful effort was made to insure that the study and the conference were adequately reported by the local press; a radio program on this same subject also was broadcast.

Telecast on KOVR

Perhaps the single most important communication project in the early part of Phase II, however, was a television broadcast made on Station KOVR on December 19, 1965. This 30-minute program consisted of a panel presentation by Dr. Gaylord A. Nelson, Dr. George W. Ebey, and Raymond M. Jansen, superintendent, Lodi Union High School District. The findings of the study were summarized by Dr. Ebey, and there followed a discussion of the report's significance for the county by members of the panel. Concluding the program, two students from Lodi Union High School, Mary Anna Tuma and Carter Bryant Dow, posed questions to the panel as to the significance of the project to their futures.

A Documentary Film

Perceiving that the broadcast quickly and effectively conveyed a summary of the project to date in terms of general understanding, Mr. Acosta arranged to have the video tape of the program copied on to 16 mm. sound film. Subsequently, he has presented this film to a variety of groups and organizations throughout the county and at a vocational guidance workshop held at California State Polytechnic College at San Luis Obispo.

To the same end of informing the general community, copies of the complete final study report were distributed to every member of the Implementation and Advisory committees, to public agencies and offices, and to a number of other key persons as well. A brief summary of the highlights of the study was also prepared as a pamphlet, and several hundred of these have been distributed.

These communicative activities have been further supplemented by speeches to various community audiences in the county from the beginning of Phase II to the present, principally by Mr. Acosta, but also by Dr. Nelson, Dr. Ebey, and other speakers.

Outside Interest

While not bearing directly on the county's internal problems, it is also indicative of the project's importance that a considerable amount of interest has been elicited from outside the county. Copies of the

Speakers at the spring symposium at San Joaquin Delta College included (l. to r.): Wesley P. Smith, State Director of Vocational Education; Dr. Julio L. Bortolazzo, President, College of San Mateo; Dr. George W. Ebey, President, Pacific Research Center, Inc.; Eric Biedermann, Best Fertilizer Company; Joseph Acosta, San Joaquin County Schools Vocational Education Coordinator; and Professor Robert Craig, San Francisco State College.

complete report, for example, have been sent upon request to points as distant as Washington, D. C., and Honolulu, Hawaii. The filmed discussion of the project, with additional remarks by Dr. Ebey, was presented to the California Junior College Association Research and Development Conference at Asilomar, California, during the weekend of March 10-12, where considerable interest was expressed. The film was shown again, and discussed by a panel of vocational and technical educators on March 14 at the National Convention of the Association for Supervision and Curriculum Development, meeting in San Francisco. The film was also viewed at a meeting of the Contra Costa County vocational education organization.

The meetings of the Implementation and Advisory committees, the particulars of which are presented in subsequent paragraphs, increased community understanding about the project. Teacher and counselor workshops, to be described later, also served this end.

The Occupational Education Symposium

Perhaps the most elaborate and certainly the most recent communicative activity, culminating this phase of the project, was the Occupational (Vocational) Education Symposium held at San Joaquin Delta College on May 23, 1966. The three-hour evening program was attended by residents from throughout the county. Addresses on the status of vocational education generally and the San Joaquin County project specifically were made by:

Dr. Gaylord A. Nelson, San Joaquin County Superintendent of Schools
Wesley P. Smith, Director of Vocational Education, California State Department of Education
Dr. Julio L. Bortolazzo, President and Superintendent, San Mateo Junior College District, College of San Mateo
Dr. George W. Ebey, President, Pacific Research Center, Inc.
Robert C. Craig, Associate Professor, San Francisco State College
Eric B. Biedermann, Personnel Manager, Best Fertilizer Company
Joseph Acosta, Vocational Education Coordinator, San Joaquin County Schools

On display were exhibits describing the San Joaquin County project, typical interdisciplinary programs aided by the Center for Technological Education, and the San Joaquin County Schools Occupational Guidance Center. Of special interest--and a productive feature--was a question-

and-answer session between the panel members and the audience. It was felt by those concerned that the symposium succeeded in registering the existence and significance of the project upon citizens and educators at both the county and state levels.

In summary, Phase II communication activities emphasized that support for an ongoing program and initiative for making extensions or revisions in it must emerge directly from the groups and individuals to be served by the program.

The Implementation Committee

Pursuant to one of the recommendations made by the Powerhouse Action Conference, an Implementation Committee was quickly organized and held its first meeting November 17, 1965, some two weeks after the conference. A complete roster of the Implementation Committee membership appears as a foresection to this report.

Meeting frequently during the course of the year, the Implementation Committee through its deliberations has become the principal instrumentality through which the initial general desire to "do something" has crystallized into a direct confrontation of the many stubborn, complex problems involved in the actual establishment of a satisfactory new program for vocational education in the county. In historical sequence, the committee has considered organization and management of the project, counseling, workshops, the master plan, and, most recently, the physical, financial, and institutional arrangements for the program.

Advisory Committee Recommended

At its very first meeting, the Implementation Committee acted upon a second recommendation of the Powerhouse Action Conference, namely, the establishment of an advisory committee. It was agreed that such a committee was required, and that it should represent every element in the community as a whole, including business, agriculture, industry, the labor and trade apprenticeship councils, government, professional groups (including teacher and counselor organizations), civic groups (such as the PTA, AAUW, BPW, and the Chamber of Commerce), and perhaps students as well. The Implementation Committee solicited suggestions and nomina-

tions for the advisory committee. Ultimately, acting in accordance with the Powerhouse recommendation and the wishes of the Implementation Committee, Dr. Nelson appointed the County-wide Advisory Committee.

The suggestions and active assistance of Implementation Committee members were also of instrumental importance in communicating with the total community about the project.

Counseling Problems

The need to improve counseling efforts which had been expressed so generally and strongly by the Powerhouse Action Conference was an early, and is a continuing, concern of the Implementation Committee. It was this concern which ultimately led to the successful countywide counselor workshop, organized at the initiative of the Implementation Committee. It will be well, however, to touch briefly on the Implementation Committee's own deliberations of the matter, especially as voiced in its meeting of December 7, 1965.

After having heard a report from the project consultant on a November 23rd meeting of the principals, vice principals, and counselors, the committee made an extensive review of the whole subject of counseling. It recommended additional use of career centers, such as the one then scheduled for March 14-18, 1966 by the County Office of Education. The committee also approved the ideas of occupational materials centers in local schools, pertinent field trips, career day programs, and an effort to counsel parents and faculty members as well as students.

To the end of furthering the professional development of counselors, the committee went on record as approving the inclusion of courses in vocational education and vocational counseling in university curriculums for counselors; released time for counselors to assist in vocational curriculum development; encouraging counselors to use student self-assessment techniques, to make more direct observation of career fields, and to conduct more group counseling programs; helping counselors to identify new career fields and to make available to students occupational information pertinent to their field of interest; development of pilot programs; and, in general, endorsing any effort to give effective counseling assistance to all students, not merely the 60 percent of the

student body counseled in typical existing programs. It was the committee's consensus that more time, money, effort, and materials were needed by counselors in order to provide them with the qualifications and, more importantly, the high motivation required for effective performance.

FEAST Trip

Responding to the desire of the committee to monitor innovative vocational education programs elsewhere, a one-day field trip for the Implementation Committee was arranged through the joint efforts of the Center for Technological Education and Pacific Research Center, Inc. On March 21, 1966, FEAST (Food Education and Service Technology) and pre-technological programs in operation were visited at Oakland Technical High School and at Pacific High School in San Leandro. A description of the FEAST program at the junior college level was also given during a visit to City College of San Francisco, and a description of the D-A-I (Design-Art-Industry) program at San Francisco State College concluded the trip.

The Master Plan

The Implementation Committee has performed what is perhaps its most strategic activity in developing the master plan for the program. In evolving this plan, the committee identified and then contended with the issues constituting the principal barriers to establishment of an actual program.

These issues included: determining which occupational areas should be included in the program and for what reason; finding a philosophy and plan which could effectively encompass the varying resources, problems, and desires of the several and dissimilar districts to be served; recognition of the need for central direction and coordination impeded by a certain reluctance to relinquish local administrative or financial prerogatives; and definition of the role of San Joaquin Delta College. In identifying and seeking to resolve these issues, the Implementation Committee--with the able assistance of the County-wide Advisory Committee--has performed an admirable community service and has set the pace for every activity reported here.

The County-wide Advisory Committee

Advisory committees perform a function which may be either frustrating and disorganizing or releasing and creative, depending purely on their leadership and attitudes. These characteristics stem directly from the function of such a committee, which is to advise without having the authority to see that its advice is acted upon. San Joaquin County, in its County-wide Occupational Education Advisory Committee, has been extremely fortunate, therefore, in having a committee which has accepted the constructive challenge of its role, under the leadership of its chairman, Eric Biedermann, personnel director, Best Fertilizer Company. The committee quickly evolved from a loose-knit group, well-intentioned but uncertain how best it might serve the project, into a puissant forum which has consistenly stimulated enthusiastic participation by members representing every segment of the community. A roster of the committee's membership appears in the front of this report.

Coming into existence in February 1966, the committee accepted its charge from Joseph Acosta, representing County Superintendent Nelson, and proceeded to organize. Mr. Biedermann was elected chairman of the committee at its first meeting, and Mr. Acosta was appointed secretary, in accordance with the Powerhouse Action Conference recommendation that he serve on both the Implementation and Advisory committees in order to effect the most efficient cooperation between them. The committee early established that it would function by replying to questions posed by the Implementation Committee.

This decision was reached after the February meeting at which the committee examined the first working draft of the master plan for vocational education, as submitted by Pacific Research Center, Inc. The committee made comments on the plan, but felt that its actual development should be a function of the Implementation Committee. Responding to that action, the Implementation Committee then tendered a list of questions to the County-wide Advisory Committee, which were studied at its March 15th meeting. Questions included:

-- How can we obtain occupational information as to the needs and trends for the county, state, and nation?

-- How can we conduct surveys to get occupational information in the county?

-- How can we identify, collect, organize, reproduce, disseminate, and continuously update resource material for the programs?

-- How can we keep the community informed about the purpose, plans, effectiveness, and problems of the program?

-- How can the community give the project service?

The County-wide Advisory Committee made substantive and constructive replies to such questions in its meetings. Details are given in the committee's meeting minutes. The principal matters considered by the committee are reported below.

Occupational Trends

The committee recognized that the rate of change in the economy makes it essential for occupational education to be responsive to occupational trends. It was further pointed out that the geographic mobility of the county's work force makes it important that opportunities for future employment outside as well as inside the county must be taken into account in revising occupational education programs. At the same time, it was realized that a program which requires local support clearly must place primary emphasis on local manpower requirements.

Occupational Information

The committee devoted substantial time to identifying sources of information related to occupational trends, and to considering how such data could best be integrated and made available to the community. While information was obtained about such sources and suggestions were made for organizing such data, the committee was unable to make a definitive statement on this matter.

Mr. Acosta, however, expressed the desire to formulate a suitable proposal. Since it was acknowledged that more information and guidance were required, he is making a field trip this summer to parallel projects in Southern California, including San Diego. It is expected that a proposal for development of an occupational information program and/or

facility will be forthcoming within the next year.

Occupational Education Standards

In the course of its meetings, the County-wide Advisory Committee found itself considering the question of quality and standards in occupational education. The consensus appeared to be that, since occupational education requirements have increased substantially during the last several years, the once-prevalent attitude of using vocational education programs as a "dumping ground" for students unable to pursue academic programs could no longer be tolerated. Such a practice was deemed unfair both to those students who can profit from such a program and to those forced into it even though prospects of success are dim.

At the same time, it was recognized that the county's educational system must provide for all students. It was pointed out that the community is unlikely to support improved occupational education standards if no provision is made for students who can benefit neither from academic curriculums nor strengthened occupational education programs.

Initiation of Occupational Education

The committee considered the question of when in the curriculum occupational concepts should be introduced. One of the members maintained that occupational education should be an integral part of every student's career from elementary school until entry into gainful employment, and the committee recognized the pertinence of this point. At the same time, it was recognized that there is a trend toward delaying specific, specialized occupational training until immediately before placement. A related point (actually introduced by Dr. George Champion at the Powerhouse Action Conference some months earlier) was that education for gainful employment can be made successfully at any academic level, depending upon the sophistication of the skill for which the education is offered.

While the committee reached no formal conclusion, the apparent consensus was that exposure to the working world should be made as early and as continuously as possible, but that advanced training--especially that requiring extensive capital equipment--should be deferred to the

secondary or junior college level as much because of the expenditures involved as to insure the currency of the skills of those entering the work force.

Occupational Counseling

The committee reaffirmed the opinion that current counseling programs in San Joaquin County were inadequate but it was unable to offer a satisfactory solution to the problem. The national concern about and inability to deal with this problem was noted.

One committee member's suggestion does deserve special mention. He proposed that regular public appearances by representatives of the numerous professions and trades be organized. He further suggested that such appearances could be scheduled and advertised on an annual basis and might well be held in public libraries. If this plan were followed, students and parents interested in a given occupation would have direct and convenient access to responsible persons working in that occupation.

In the course of its meetings, the committee also touched on most of the general issues in occupational education; those mentioned briefly above, however, were among the outstanding matters investigated, and suggest the tenor of the committee's contribution to the project. The County-wide Advisory Committee is fulfilling its mission of seeking to determine and to communicate the community's wishes and opinions about occupational education in the county.

Interdisciplinary Teacher Workshop

Following through on a commitment made at the Powerhouse Action Conference, the Center for Technological Education, San Francisco State College, conducted an interdisciplinary workshop for San Joaquin County teachers during the spring semester, 1966. The Center originated the interdisciplinary approach to technological education and is currently working with more than 20 programs at the secondary and junior college levels.

The workshop, which was given for academic credit through the extension division of San Francisco State College, was taken on that

basis by 45 teachers and audited by 9 more for a total attendance of 54 persons, comprising interdisciplinary teams from Escalon, Linden, Manteca, Tracy, and Lincoln districts, and from Franklin and Stagg high schools in Stockton. Instructors for the workshop were Robert Craig, associate professor of education at San Francisco State College and consultant coordinator of the Center for Technological Education; and Winston Howe, team participant in the original pre-technological program at De Anza High School in Richmond several years ago, and presently head of the industrial arts department there.

Objectives of the teacher workshop were as follows:

1. To convey the history and philosophy of other pre-technological education programs now in operation in the Bay Area.
2. To review and outline procedures for curriculum writing.
3. To give teachers an opportunity to work together in interdisciplinary teams in developing programs which would best meet the needs of their respective schools.

Teacher teams were organized during the initial meeting held February 10th at the San Joaquin County Instructional Materials Center. The teams met weekly in their respective districts. The second general meeting on April 14th was conducted by Dr. Robert Weisgarber, director of the audio-visual center at San Francisco State College. He discussed interdisciplinary use of media and materials; this made it possible to develop instructional materials as the various curriculums were being written. The weekly workshop meetings then continued through April and May, concluding with the general community symposium held at San Joaquin Delta College on May 23rd.

New Programs Planned

The result of this workshop was a set of program guides for new curriculums in occupational education to be introduced this fall. Curriculums have been confirmed and students selected for new programs at Tracy, Manteca, and Lincoln, and at Franklin High School in Stockton. The program areas are:

1. Linden: Modern farm engineering, agricultural science, and mathematics for a rural school.

2. Manteca: Pre-engineering technology.

3. Lincoln: Pre-engineering technology.

4. Stockton:

   Franklin High School: Electronic technology.
   Stagg High School: In progress.

5. Tracy:

   Senior Elementary School: Electronic technology.
   Union High School: Automotive technology.

6. Escalon: In progress.

Professor Craig reported that, while some teams made more progress than others, much has been done overall to change the pattern of program development. At the request of the participants in this year's workshop, the Center for Technological Education has recommended a second workshop for 1966-67, and it is expected that this workshop will indeed be held.

Counselor Workshop

Responding to the expressed need for a fresh approach to vocational counseling, the County Superintendent of Schools Office, with the assistance of Pacific Research Center, Inc. and the Center for Technological Education, conducted a workshop for counselors and educational administrators responsible for counseling activities. At the first meeting held December 6, 1965, specific details of requirements for improving counseling efforts were deliberated. A brief summary of the group's findings follows:

Generally speaking, more of everything is needed:

-- time for counseling.

-- money for acquisition of resources.

-- collection of vocational education materials in a suitable form.

-- and, most of all, support and encouragement by the community and by school administrators for counseling programs.

Counselors should be given released time to:

Participate in guidance centers.

Develop occupational literature files and lists of resource persons.

Become familiar with the goals and interests of individual students.

Conduct research.

Make professional visits to employers.

Conduct group counseling.

Improve their general professional skills and knowledge about the changing world of work.

As for the students, they and their parents need easy access to a comprehensive, constantly updated occupational information center. They need the opportunity to visit on the job in fields of occupational interest, and to talk with individuals working in those fields. Student contact with counselors should begin in the ninth year at the latest, and preferably before then. There should be sufficient opportunities for students to be counseled in the company of their parents. There should be counseling for all students, including adults, not only for the top 60 percent of the student body.

At the suggestion of the project consultant, and with the financial assistance of the Center for Technological Education, Dr. H. Bonner McDaniel of Stanford University, noted national authority in educational counseling, met with the counselors on two separate occasions. Dr. McDaniel stressed acceptance of the student as a person in order to build self-respect and self-confidence. He emphasized the importance of cumulative data for counseling, as well as a systematic gathering of information on occupational alternatives. He asserted that helping students make tentative occupational decisions is extremely valuable, as are efforts to localize current information on employment opportunities.

He also mentioned the importance of early and continuous involvement of the student in counseling, with parents, community leaders, and educators all playing active roles. Dr. McDaniel made available a variety of professional materials relating to counseling.

Counseling Evaluation Checklist

As a result of the counselor workshop, a comprehensive booklet and checklist for evaluation of counseling programs especially designed for San Joaquin County schools was developed for distribution in the fall of 1966. The document, Appraising the Adequacy of the School's Vocational Guidance Program, is reproduced as Appendix B of this report. It was the joint product of the San Joaquin County Superintendent of Schools Office, the State Department of Vocational Education, the State Department of Employment, the San Joaquin County high school districts, San Joaquin Delta College, San Francisco State College Center for Technological Education, and Pacific Research Center, Inc. It is considered that this document will be of great value in defining the needs of counseling programs in the county as a preliminary to proposing corrective action.

Counseling Proposal Development

In parallel with the counselor workshop, the Center for Technological Education, represented by its assistant director, Anthony Maniscalco, has been working with a small group of counselors and administrators in the county to develop a proposal for serving, analyzing, predicting, and improving countywide communication among schools and industry with respect to occupational information, placement, and general liaison. As of the date of this report, a proposed statement of objectives for the project has been formulated and is under consideration.

Occupational Information Center

As has been mentioned, Joseph Acosta, of the County Superintendent of Schools Office, is pursuing the indicated need for an occupational information center. Having studied the matter, he has made preliminary explorations in cooperation with Pacific Research Center, Inc.; he is

making a field trip this summer to experimental projects in San Diego and other Southern California counties prior to writing a comprehensive proposal.

Occupational Guidance Center

One of the most important accomplishments of the year was made under the direction of Leonard Beeman, County Coordinator of Secondary Education, with the close cooperation of Donald E. Cerqui, Diamond Walnut Growers, Inc., who served as co-director. This was the First San Joaquin County Occupational Guidance Center, held at the county fairground March 14-17, 1966. Formal planning for the center began as long ago as 1964 when George Cornwell, Pacific Gas & Electric Company, Stockton, and president of the San Joaquin County Industry-Education Council, suggested such a project to Dr. Nelson and to A. L. Buffington, general manager, Diamond Walnut Growers, Inc.

After a visit to the highly successful Occupational Guidance Center in San Mateo County, a local survey revealed strong endorsement by representatives from labor, industry, business, and education for the institution of such a program in San Joaquin County. This led to formation of a countywide steering committee and ultimately to the guidance center, funded by the County Superintendent of Schools Office with money made available under Title V-A of the National Defense Education Act, as well as by contributions from the San Joaquin County Board of Supervisors and numerous organizations and service clubs throughout the county.

Basically, the center is a means of bringing secondary school students into brief but direct contact with actual representatives from a variety of occupations in a setting where information is effectively conveyed through formal presentations and question-answer sessions. A roster of the Advisory-Steering Committee for the center appears as Appendix C of this report.

Scope of the Occupational Guidance Center

The center was attended by 4,950 students from 16 county schools, including Bidwell, Edison, Escalon, Franklin, John Sutter, Lincoln,

Linden, Lodi, Manteca, Ripon, Ripon Christian, St. Mary's, Schneider Vocational, Stagg, Tracy, and Stockton Unified School District Continuation. Giving information to the students attending the center were 102 consultants from 43 occupational areas including agriculture, forestry, finance, insurance and real estate, advertising, electrical engineering, electronic engineering, civil and aeronautical engineering, fine arts, medicine, dentistry, pharmacy, veterinary science, laboratory and chemical technician, medical assisting, nursing, U. S. Army and Air Force, U. S. Navy and Marines, missiles technology, secretarial services, data processing, biology, journalism, law enforcement, legal professions, library science, religion, psychology and sociology careers, teaching, telephone careers, airline hostess, airline pilot, air traffic agent, architecture and interior decorating, cosmetology, home economy and fashion designing, automotive technology, carpentry, electricity, electronics, operating engineering, culinary arts and meat cutting, purchasing, and apprenticeship.

Evaluation reports on the center were submitted by the students, teachers and counselors, industrial consultants, and by the center's co-directors. Enthusiasm for the center was widespread and a number of suggestions were made for enlarging and strengthening the program in future years. It is anticipated that the Occupational Guidance Center will become an annual institution in San Joaquin County and that it will fill a gap that has long been felt. While, as Dr. Nelson has said, "A one-shot program is not a cure-all," it is a step in the right direction and possibly a focal point for stimulating guidance by the home, the school, and the business community. It is to be presumed that those who cooperated in conducting the center gained at least as much in understanding and communicating with each other as was gained by the students for whom the center was intended.

The Master Plan for Occupational Education in San Joaquin County

One of the major recommendations of the Powerhouse Action Conference was that a master plan for occupational education in the county be developed. In the ensuing year, continuing thought and discussion were devoted to this top-priority subject. A first working draft of such a

plan was developed by the project consultant and presented in February for study and exploration by the County-wide Advisory and Implementation committees. Consideration of this draft plan revealed substantial issues which have not yet been but which must be resolved before an effective countywide program can be established. These include determining the pattern of leadership, agreeing upon the physical and organizational setting, devising a feasible financial plan, and distributing responsibility in such a way as to maximize effective cooperation and coordination while maintaining local control of students and programs.

Central Issues of the Master Plan

Out of the master plan deliberations, several central issues emerged. These were: What is to be the role of San Joaquin Delta College in occupational education for high school students in the county? Shall the voters be asked to approve a tax under the provisions of Senate Bill 930 for the purpose of supporting a new occupational education program? Precisely how could such a tax legally be used? How could it equitably be used to satisfy the differing needs of the small and large school districts?

Role of San Joaquin Delta College. The role of San Joaquin Delta College in the program now seems to have been somewhat clarified. The minutes of the June 2nd meeting of the college administrative council contained the following statement:

> A motion was made by Mr. McNeilly, seconded by Dr. Holton, that the council give an expression of their attitude concerning the inclusion of high school students, namely: that if the need is present and financial and other arrangements can be worked out, the council endorses the idea of accommodating high school students in the technical classes.

This motion was reported to and discussed by the County-wide Advisory Committee at its last meeting of the year on June 7, 1966. It was pointed out that the resolution expresses the consensus of the administrative council only, and has not yet been acted upon by the junior college board. The committee concluded that the resolution should be construed to encompass accomodation for high school students in all technical division classes at the college. The committee passed a reso-

lution endorsing the council's action and forwarded it to the San Joaquin Delta College Board of Trustees.

While the junior college administrative council's action is only a beginning, it is significant. As one member of the County-wide Advisory Committee remarked, "Finally, we have someone who says, 'We will accept high school students'". The issue was further complicated by the defeat of construction bonds for the new San Joaquin Delta College campuses in the June 1966 election.

Taxation Considerations. Another complex matter is the issue of taxes authorized under Senate Bill 930. This bill provides that a tax assessment of no more than ten cents per $100 assessed property valuation can be levied for the purpose of establishing regional occupational centers for all or part of a county, including a maximum of five cents taxation for capital outlays. Unfortunately, no final legal interpretation has been made as to whether part of the tax can be used only for planning a new physical facility or, alternatively, whether a part of the tax may be used to plan for new programs and equipment in existing facilities. In this uncertain situation, some school districts have been understandably reluctant to endorse the tax proposal, especially smaller districts in the outlying regions of the county.

Possible Alternatives

These issues were confronted squarely by the Implementation Committee at its last meeting of the school year on May 31, 1966. Four alternative courses for action were proposed:

1. Interdistrict agreements among the high schools
2. All programs organized and directed through San Joaquin Delta College
3. Comprehensive programs in the high schools
4. No action of any kind

After prolonged deliberation, the committee decided that the project consultant should make specific recommendations for consideration and action by a second Powerhouse Action Conference, now scheduled for

October 7-8, 1966. It is intended that this conference will decide on the precise action to be pursued in establishing the countywide occupational education program and that the consensus of the conference will be upheld by all parties.

Pursuant to this decision, the project consultant staff conducted a series of interviews with school district administrators throughout the county in order to develop a constructive, reasonable proposal on which to base a pilot program. Additionally, using the responses made by the County-wide Advisory and Implementation committees to the first working draft of the master plan, PRC is preparing a revised draft of the master plan. Work is well-advanced on this second draft, and it is believed that an acceptable master plan for occupational education in San Joaquin County will be forthcoming shortly.

V conclusion

SECTION V

CONCLUSION

"If you think you have troubles, wait until you hear about mine." Like all cliches, this expresses a prevalent truth in human affairs and one most pertinent to San Joaquin County's occupational education project.

No one associated with the project is satisfied. No one is complacent about the progress which has been made so far. Everyone is troubled as he comes to grips with the situation. The consensus to resolve the financial and organizational issues has not yet been completed. San Joaquin Delta College faces delays in building its new campuses just as the college has indicated its willingness to take part in an occupational education program. In view of these facts, what has been accomplished?

Two years after the study was first suggested, the project exists, is in force, and its momentum is growing. Membership on the Implementation and County-wide Advisory Committees is stable, and the members are vigorously engaged in executing their responsibilities. A member of the San Joaquin Delta College Board of Trustees has joined the County-wide Advisory Committee. A county supervisor has evidenced interest in the work of that committee and his desire to attend its meetings. Individual school district superintendents have made known their disposition in principle to make new interdistrict agreements.

The Ford Foundation, through the Center for Technological Education, has indicated its awareness of the project and an appreciation of its importance. The California State Department of Vocational Education is assigning a representative to the Implementation Committee, participated in the spring community symposium, and has shown a willingness at the highest level to maintain its interest in the project. Individuals in other counties and states have requested information on developments in the program. Business and community leaders are increasingly involved,

as witness the scores who made extensive contributions of time and effort to the Occupational Guidance Center.

As was the case two years ago, San Joaquin County (along with many others) remains caught up in the sweep of technological and economic change. The cost of all forms of education--perhaps occupational education especially because of its necessarily great investment in equipment--is increasing steadily. The discrepancy between the number of students to be taught and the number of teachers available to teach them is greater now by a significant amount than it was in 1964. Further, looking around the nation, and particularly around California, there is apparently no "magic wand" by means of which the complex problems in this field can be dispelled with a single stroke. Rather, there is ample evidence that many communities have been unable even to begin examining their requirements.

All this is not to say that San Joaquin County should be complacent. While the problems of occupational education most certainly will remain with us, creative and practical solutions are certain only if imagination is supported by a vigorous effort and by the conviction that solutions can be found. Solutions to any human problem are found in the resources, capacity, and will of the people involved. When one examines the persistence, the vigor, and the imagination with which the people of San Joaquin County are attacking the problems of occupational education, the prospect is excellent. The campaign has been mounted, it is being continued, and important milestones already have been passed. Other important ones lie directly ahead, such as the second Powerhouse Action Conference. The most reasonable forecast, therefore, is that the program this year can be expected to yield rich dividends from the great investment of effort which has been made by every element in the community throughout the course of the project.

APPENDIX B

APPRAISING THE ADEQUACY OF THE SCHOOL'S VOCATIONAL GUIDANCE PROGRAM BY ADMINISTRATORS, COUNSELORS, STUDENTS, FACULTY

Developed as part of the Vocational Education Project

A joint effort of the County Superintendent of Schools Office, State Department of Vocational Education, State Department of Employment, San Joaquin County High School Districts, San Joaquin Delta College, San Francisco State College Center for Technological Education, and Pacific Research Center, Inc.

This document provides a series of critical questions pertaining to the various elements of an effective vocational guidance program. This appraisal guide may be used either for the purpose of self-study by a school group or with the added objectivity of an outside consultant or committee. This work group from the San Joaquin County Schools suggests that the school that has an adequate program can answer yes to all of these questions. Questions which cannot be thus positively answered represent areas which need further development.

Dr. Gaylord A. Nelson
Superintendent
San Joaquin County Schools
June, 1966

INSTRUCTIONS

This booklet was developed to be used as a check list for appraising the adequacy of the school's vocational guidance program.

This booklet can be used by the administrator, counselor, faculty, and students.

The accompanying answer sheet is designed so that the questions can be answered in the designated group column pertaining to the person making the appraisal. Also, the questions which do not apply to the particular group are blocked out. Only those questions not blocked out in the columns should be answered.

EXAMPLE (an administrator answering question)

SECTION	STUDENT		FACULTY		ADMINISTRATOR		COUNSELOR	
	yes	no	yes	no	yes	no	yes	no
I.								
1.	XXXX	XXXX	XXXX	XXXX				
2.	XXXX	XXXX						
3.			XXXX	XXXX				

I.
GENERAL ADMINISTRATION

1. Does the administration provide excellent leadership and support in developing the occupational guidance program?

2. Is there a definite program to gain the full support of and to involve the total faculty, the home, and appropriate community agencies and leaders?

3. Are there sufficient funds, facilities, and qualified personnel to provide an excellent occupational guidance program?

II.
ORIENTATION PROGRAM

1. Is there a coordinated and continuing occupational orientation program for all students beginning in the elementary program and continuing through the community college?

2. Does the occupational orientation program provide:
   a. Direct student contact with the world of work?
   b. Parent conferences?
   c. Specific and extensive community involvement?

3. Does the program provide sufficient experiences and test results that the student can make a satisfactory self-appraisal of his abilities and interests?

III.
APPRAISING PROCEDURES FOR STUDYING INDIVIDUAL DIFFERENCES FOR OCCUPATIONAL USE

1. Is the occupational counselor provided with accurate, complete information regarding each student, and is it interpreted to students and teachers?

2. Is this information accumulated and maintained in an efficient, usable manner with sufficient clerical help?

IV.
OCCUPATIONAL COUNSELING

1. Is there an effective, well coordinated placement service?

2. Is there an effective, systematic, ongoing follow-up program which has impact upon curriculum development and guidance programs?

3. Does the county and each secondary school district have a qualified professional providing full-time leadership to the coordination and development of occupational guidance? Does this person have the personnel, materials, and space necessary to do his job effectively?

4. Does each high school have a qualified professional responsible for the coordination and implementation of the occupational guidance program? Does he have the resources necessary to perform his functions adequately?

5. Is there a continuing program for upgrading the competence and knowledge of the counseling staff in the field of occupations?

6. Is the occupational guidance program throughout the county coordinated with related occupational programs, such as MDTA and NYA?

7. Are the objectives of the total occupational program clearly defined?

8. Is there a major evaluation at least every four years to determine how effective these objectives are being achieved?

9. Do the elementary schools of the county acquaint children with the world of work, particularly with respect to the industries and occupations in their community and regions?

10. Do members of the staff regard vocational counseling as a specific activity which involves certain definite knowledges and skills?

11. Are vocational counselors selected on the basis of the personal traits, experience, and training which equip them to deal with career decision problems effectively?

12. Are vocational counselors used as resource persons by other members of the staff?

13. Is the vocational counselor involved in the school's curriculum development program?

V.
APPRAISING INFORMATION SERVICE

1. Does the school have a systematic program for acquiring educational-vocational information materials--National, regional, and local?
2. Is there evidence that advancing technological methods are being used for handling, processing, storing, and recovering information?
3. Is this information made positively accessible in classrooms, libraries, and guidance offices?
4. Are specific leadership assignments and budget allowances made for keeping these materials current?
5. Is career guidance information disseminated to the student at a time appropriate for the decision-making necessary at his developmental level?

VI.
APPRAISING THE GROUP GUIDANCE PROGRAM

1. Is there a well planned program of group guidance being carried out in the school? Are these group guidance activities planned in such a way that they help prepare students to make decisions relative to their programs and vocational goals?
2. Do occupational guidance counselors have the necessary training or personal background necessary for effective occupational group guidance? Are they provided with necessary materials or clerical help, and is there an opportunity provided for occupational in-service time for counselors and teachers in occupational group guidance?

VII.
APPRAISING GUIDANCE CURRICULUM RELATIONSHIPS

1. Do members of the guidance staff regularly participate with curriculum development groups and programs in the school?
2. Does the guidance staff analyze, organize and present to the total staff data on individual characteristics of students for the purpose of assisting in the evaluation and improvement of the school's curriculum?

3. Are students who would benefit by special curricular adaptations to individual handicaps or special abilities identified and reported to the staff?

4. Do teachers plan the content of their courses and their classroom activities with regard to available information concerning the problems, interests, and abilities of students?

5. Are regular follow-up studies of both graduates and dropouts carried on? Is the information gained meaningfully communicated to teachers and curriculum development groups?

6. Is there evidence that these findings have resulted in appropriate curriculum change?

7. Do the administrative and curricular practices of the school foster attitudes of belonging and student participation in the whole range of school activities for vocational students?

VIII.
APPRAISING GUIDANCE - COMMUNITY RELATIONSHIPS

1. Is specific machinery set up for teachers to observe different neighborhoods, industries, business, and services of the community?

2. Are specific data gathered and disseminated to describe the various socio-economic, racial, educational-occupational groups from which the students come with particular reference to the educational and career horizons and limitation for these young people?

3. Are periodic studies made and disseminated to all school staff members of the significant local trends in population and industrial development and community-organizational structure as these relate to opportunities for youth in the community?

4. Is there a community-industry-educational council or committee which participates in planning, operating and evaluating this guidance function?

5. Does the guidance staff maintain direct personal relationships and effective interaction plans with all agencies serving youth? These should include employment agencies, both public and private, recreational departments, and other agencies, as well as psycho-diagnostic and treatment facilities.

6. Is there a person with specific assignment for leadership?

IX.
APPRAISING PLACEMENT SERVICES

1. Does the school provide an organized placement service that is adequate in terms of the needs of its students?
2. Are public employment services and other community resources used to good advantage in developing school placement services?
3. Is assistance provided for all students (including graduates and dropouts) who need help in securing employment?
4. Are students kept informed as to the placement services provided by the school?
5. Does the school have a central placement desk or office which encourages students to use the services?
6. Are the placement activities of different staff members coordinated in such a manner that periodic reports on all school placements are available to the staff and general public?
7. Are efforts made to maintain frequent and regular contacts with potential employers of students, dropouts, and graduates?

X.
APPRAISING FOLLOW-UP PROGRAM

1. Are students who drop out of school interviewed as they leave in order to secure information concerning their reasons for leaving and their plans?
2. Is follow-up study data used to help students make decisions?

*AREA VOCATIONAL SCHOOLS; *OCCUPATIONAL GUIDANCE; ORIENTATION; JOB PLACEMENT; GRADUATE SURVEYS; PUBLIC RELATIONS; TESTING; ADMISSION CRITERIA; *GUIDANCE PROGRAMS; SURVEYS; *PROGRAM DEVELOPMENT; GUIDELINES CARBON COUNTY; PENNSYLVANIA

Vocational-technical schools were surveyed to determine present guidance procedures, and resulting information was used to help establish a comprehensive guidance program. The orientation of students is extremely important in guidance programs because students who have inaccurate and limited knowledge will make inadequate decisions. Some means to be used in orientation to vocational-technical schools are assembly programs, films and slides, school publications, guided tours, published articles, radio and television programs, newsletters, and special summer courses. Student selection by counselors will be based on age and grade level, physical defects, academic record, discipline record, attendance and tardy records, test scores, and recommendations. Tests as guidance instruments are to be used both for predictive and descriptive purposes. Aptitude Test Battery, interest inventories, and reading tests will be part of a uniform comprehensive testing program recommended for use in the county. Job placement will be a cooperative operation of vocational instructors, the student service coordinator, and the State Employment Service. Since graduate followup information is useful but difficult to obtain, birthday cards and newsletters are to serve as vehicles for followup questionnaires. (1) Course offerings, (2) admission, interview, and questionnaire forms, (3) a list of schools visited, and (4) a bibliography are included. (EM)

ACKNOWLEDGMENTS

The initial idea for this research project, plus the subsequent work involved in developing the written request was performed by Mr. James O. Tule, the present Director of the Carbon County Area Vocational-Technical School. He also contributed many ideas and suggestions during the actual development of the study. Without his encouragement and assistance this project would not have been possible.

Mr. R. N. Davenport, Carbon County Superintendent of Schools and the Assistant County Superintendent, Mrs. Esther Gross also contributed valuable counsel.

The information obtained in interviews with the following people form the basis for much of the thinking in this report. Many thanks to: Mr. Robert Hontz and Mr. Edward Smith, Guidance Specialists from the Pennsylvania Department of Public Instruction; Mr. George W. Elison, Director of Vocational Education in the Allentown Vocational-Technical School, Allentown, Pennsylvania; Mr. Robert A. Nagle, Director, Mr. William Loomis, Coordinator, and Mr. Stephen Mott, Student Service Coordinator, Area Vocational-Technical School, Easton, Pennsylvania; Mr. Franklin J. Brown, Guidance Counselor, Area Vocational-Technical School, Bethlehem, Pennsylvania; Mr. Robert Miller, Guidance Counselor Coordinator, Bucks County Technical School, Fairless Hills, Pennsylvania; Mr. Frank E. Stewart, Acting Principal, Brooklyn Technical High School,

Brooklyn, New York; Mr. Harold J. Peck, Director, and Mr. Brad Hartman, Director of Guidance, Central Dauphin High School, Harrisburg, Pennsylvania; Mr. Irvin Wheatley, Director of Guidance, Seaford High School, Seaford, Delaware; Mr. Frederick C. Kerr, Guidance and Curriculum Director, Upper Bucks County Area Technical School, Perkasie, Pennsylvania; Mr. James Finn, High School Coordinator, and Mr. Richard Paulson, Vocational Counselor, Williamsport Area Community College, Williamsport, Pennsylvania.

Mr. Clyde Messinger, Area Coordinator for Industrial Education, Department of Public Instruction, also contributed material which aided in the preparation of this manuscript.

A final word of thanks to Miss Darlene Witt, a most competent secretary, for her devoted work.

The following outline represents the initial request for funds to finance the Guidance Research Project.

A COMPREHENSIVE GUIDANCE PROGRAM FOR THE AREA VOCATIONAL-TECHNICAL SCHOOL

1. *Problem:*

There is a definite lack of knowledge for the implementation of an effective comprehensive guidance program for the Area Vocational-Technical School. To date, vocational guidance programs in Pennsylvania have been in lock step with the comprehensive high school guidance programs which are basically college-preparatory oriented. Current methods and techniques are not applicable to the Area Vocational-Technical School. New programs of orientation, diagnostic testing, continuous guidance, follow-up, placement, and evaluation will become the keystone to success for the Area Vocational-Technical School. Guidance Counselors and their programs play an important role in the identification of students selected for the Area Vocational-Technical School.

2. *Background Information:*

Identification of this problem can be recognized only after a review of current facts.

a. Comprehensive guidance programs for Area Vocational-Technical Schools are limited in number.

b. Current programs center around school achievement and I.Q.

c. Too many programs are designed for student acceptance or rejection, and not successful placement.

d. There is a definite lack of guidelines for the development of a sound comprehensive Vocational Guidance Program.

3. *General Description, Importance, and Need:*

It is the belief of the applicant that there is great need for a sound comprehensive guidance program to be developed within the Area Vocational-Technical School. It

46

is the belief of the Advisory Committee that such a guidance program will be a major factor in students' educational success. Major emphasis of current programs has been in the area of college-oriented students.

4. *Objectives:*

a. To develop guidelines for an effective comprehensive guidance program to be implemented in the Area Vocational-Technical Schools in Pennsylvania. This development to be based upon a study, analysis, and evaluation of:

(1) Existing programs.
(2) Basic tests and measuring devices.
(3) Successful guidance methods and techniques currently employed.
(4) Student placement and employment.
(5) Student follow-up.
(6) Program evaluation and appraisal.

b. To develop a comprehensive written report, entitled, *"Guidelines for a Comprehensive Guidance Program for the Area Vocational-Technical School"*, for distribution to all existing and proposed Area Vocational-Technical Schools and the Department of Public Instruction.

5. *Advisory or Consultant Group:*

Robert Hontz -- Director of Guidance and Testing, Department of Public Instruction.
Clyde Messinger -- Area Coordinator for Industrial Education, Department of Public Instruction.
Michael Hudasky -- Guidance Counselor, Jim Thorpe Area Joint Schools, Jim Thorpe, Pennsylvania.
Ernest Koegel -- Guidance Counselor, Lehighton Area Union School District, Lehighton, Pennsylvania.
Emma Schlegel -- Guidance Counselor, Palmerton Area School District, Palmerton, Pennsylvania.
Michael Bonner -- Guidance Counselor, Panther Valley Joint Schools, Lansford, Pennsylvania.
John Timko -- Guidance Counselor, Weatherly Area Joint Schools, Weatherly, Pennsylvania.

6. *Procedures, Methods, Mechanics:*

The major elements of this program will be:

a. To visit current vocational guidance programs now being used, to study these programs, analyze and evaluate their effectiveness, to disseminate all information accumulated, select the most effective methods and techniques in guidance and develop it into a program for the Carbon County Area Vocational-Technical program. I think the first procedure in such a study would be the employment of a guidance director who will serve the Carbon County Area Vocational-Technical School.

b. Establish meetings with the selected Advisory Committee to review the objectives of this program and to develop criteria for the study.

c. To develop a school visitation schedule.

d. To develop methods for recording and analyzing information secured through visitations and observations.

e. To conduct visitations which will provide the desired information, and to analyze and record observations of these visitations.

f. Evaluate and disseminate the collected information.

g. Develop a comprehensive guidance program for Carbon County Area Vocational-Technical School.

h. Implement the proposed program.

i. Re-evaluate methods and procedures developed.

7. *Personnel:*

The following people shall participate in this proposed study:

a. Local Director of Vocational-Technical Education, James O. Tule, will devote whatever time is required to provide proper supervision for this study.

b. Guidance Director - Time devoted to this project - 1 year, full time. This person should be a qualified guidance director. One who has had experiences in education; one who has had experiences in the industrial field of work; one who is capable, progressive, and aggressive. It shall be the responsibility of this guidance director to develop, proceed, and follow through the objectives of this study.

c. Area Coordinator for Vocational-Technical Education, State of Pennsylvania - Clyde Messinger. This person shall act as a consultant.

d. Local School Guidance Counselors (5) - Michael Hudasky, Jim Thorpe Area Joint Schools; Ernest Koegel, Lehighton Area Union School District; Emma Schlegel, Palmerton Area School District; Michael Bonner, Panther Valley Joint Schools; and John Timko, Weatherly Area Joint Schools. Time devoted shall be as required. Capacity - Advisory Committee and consultants.

e. Guidance Consultant - Robert Hontz, Department of Public Instruction. Consultant as required.

8. *Administration - Supervision:*

The Director of Vocational-Technical Education for Carbon County Area Vocational-Technical School shall be responsible for the administration and supervision of the proposed study. Throughout the study, meetings for coordination and development of the proposed study will be called as necessary; in addition to bi-weekly scheduled meetings, at which time complete reviews, future developments and planning will be considered.

9. *Time Schedule:*

I propose that one year (12 months) be devoted to this study. That this study begin on June 15, 1965, and continue until June 15, 1966. I further propose that a re-evaluation be completed during the month of July in the years 1967, 68, 69, and 70, so that as this program is developed, a continual revision and evaluation shall be made over a five-year period. I would propose the following 12 months' schedule, however, reserving the right to change the time schedule allowing whatever flexibility is necessary for the successful completion of this project. Preparatory study - 1 month; School visitation and assembly of materials - 2 months; Analysis of study - 1 month; Development of local program - 1 month; Implementation of program - 6 months; Evaluation of the program - 1 month.

10. *Evaluation:*

It will be very difficult to evaluate the success of such a program within a short period of time. It is for this reason that I have included in my time schedule a

re-evaluation to be submitted over a period of five years. Through a study of the success and enthusiasm of the students, and cooperating schools, we will be able to determine the effectiveness of a comprehensive guidance program. The evaluative procedures to be employed would be the responsibility of the vocational guidance director and his advisory committee.

11. *Facilities:*

The Carbon County School Board shall provide office facilities, as required, to satisfactorily conduct this program.

12. *Report:*

The Carbon County Area Vocational-Technical School shall provide the State Department with copies of all information gathered and developed through this study. It shall provide minutes of all advisory committee meetings; it shall provide copies of studies, analyses, and evaluation materials as collected and are pertinent to this study. It shall provide the State with copies of guidelines to be used in the development and implementation of a comprehensive orientation guidance and follow-up program for use in Area Vocational-Technical schools. The school shall provide the opportunity to anyone who wishes to visit, a review of the program as developed, and an opportunity to discuss with any school personnel the purpose and effectiveness of the program.

INTRODUCTION

This study was designed to accomplish two main objectives: (1) to survey a number of vocational-technical schools to determine what guidance procedures are presently being used, and (2) to use this information to help establish a comprehensive guidance program for vocational-technical education in Carbon County.

In order to facilitate the study of existing guidance programs in vocational-technical schools, five specific areas were selected for concentration: orientation, student selection, testing, job placement, and follow-up.

Orientation involved the study of methods being used to inform students, parents, and teachers of the opportunities available through vocational-technical education. Since this form of education is relatively new to Carbon County, much time was devoted to developing and presenting vocational information to students and adults.

Methods of selecting students to attend vocational-technical schools offered the opportunity to evaluate present procedures and make recommendations. The use of tests as guidance tools in counseling and the extent of their use as a selection device was also ascertained.

How are students placed in business and industry after graduation? Who is responsible for placement? Why? What happens to these students after they are placed? How

effective has their training been? How successful are these students? What percentage of these students decide to go on for further schooling? These and many more questions formed the basis of inquiry for this study.

To facilitate the dissemination of vocational school information, a Guidance Advisory Committee was established in Carbon County composed of guidance counselors from each of the participating schools in the district. A guidance specialist from the Department of Public Instruction was also part of the committee. This committee met monthly to discuss the collected information and to help establish a guidance program for the county. The cooperation of this committee proved extremely helpful in the tremendous task of explaining the purposes of vocational education to students and interested adults. Although the committee met for 2 1/2 to 3 hours each month, this proved to be insufficient time to discuss the many facets of vocational-technical school training. The number of students requesting Data Processing, for instance, actually doubled, after a representative of the IBM Company spoke to the counselors. If a representative from each course area in the school could have outlined employment opportunities in his field, this would have enabled guidance personnel to counsel more effectively.

There appears to be a number of obstacles preventing guidance counselors and vocational educators from doing a more effective job. The following statements are based upon observations and deductions after numerous vocational school

visitations and conversations with vocational educators and counselors.

According to Dr. Franklin J. Keller, in his excellent study of *Vocationally Talented Pupils*, "On the whole, the vocational education process suffers more from inadequate (underlining mine) guidance than it does from competing academic education." Because of inadequate guidance many vocationally talented students are lost. Why? Why are these students not identified and counseled? Since the purpose of guidance is to help students make decisions relative to their potentialities, somewhere the system is not functioning properly.

Many teachers have had no experience in trades that are taught in vocational schools. Because of this, they lack understanding and tend consciously and unconsciously to demean vocational education. Their background experience is college oriented, and their advice to students is naturally predicated along these lines. Vocational educators complain that many counselors, especially women, have likewise not had industrial experience and tend to favor professional occupations over manual trades. It might be noted that our society as a whole, and parents in particular, share in this overemphasis on professional level jobs. Much of this overemphasis can be attributed to the educational hysteria engendered when the Russians launched Sputnik I. Educational critics pointed to the fact that many students who were capable of doing college level work were not going to college. Since this was a terrible

waste of our country's human resources, a campaign was immediately launched to extoll the virtues and rewards of a college education.

If we assume that 40% (an extremely liberal figure) of the school population is capable of four years of college training, and approximately 30-35% actually attend college, then this campaign was aimed at a very small portion of our total school population. However, the results of this campaign have had a tremendous effect on the thinking of people concerning jobs. Professional level jobs have increased in status and prestige to the extent that parents and students feel they cannot be completely successful without the college degree. According to Darley and Hagenah, "In a relatively mobile society such as ours, job titles and the hierarchical arrangement of jobs by perceived prestige and status levels represent the American equivalent of aristocracy."

When students are asked, "Should everyone go to college?" The answer is variably, yes. This type of reasoning should be followed by qualifying statements. Statements which many times are not forthcoming.

When students think of advanced schooling, they invariably think of four year college programs. Junior and Community College programs have not been adequately incorporated into the thinking of 9th grade students ready to make decisions which may affect the rest of their lives. Thus many vocational and technical level programs which will, in the future, require

more and more advanced schooling in two year colleges are not given adequate consideration.

Abraham H. Lass, Principal of the Abraham Lincoln High School in Brooklyn, in an article for the *Saturday Review* stated, "There is too little thinking about why a student should go to college, or even if; the emphasis is simply on where. It is a mischievous and destructive myth that everyone must go to college (preferably a four-year liberal arts college), that all wisdom and decency reposes with the college educated."

Vocational education must constantly strive to improve its image in order to combat the fact that job status is constantly associated with a college degree. John Gardner has stated, "The society which scorns excellence in plumbing because plumbing is a humble activity and tolerates shoddiness in philosophy because it is an exalted activity will have neither good plumbing nor good philosophy. Neither its pipes nor its theories will hold water."

Pressures from the community, from parents, and from academic educators have helped to overemphasize college education. Many counselors have succumbed to this pressure and consequently overemphasize college counseling. The fact that more usable information is available for college counseling than for vocational counseling is also an important factor.

Because of this, guidance has become alienated from vocational education. Distrust of guidance counselors by

vocational educators has caused many of the problems discussed above. A lack of guidance personnel in vocational schools has prevented the adequate distribution of materials necessary for students to make vocational decisions.

Guidance counselors motivate many students to undertake college level work. How much do they influence students to begin vocational training? Vocational educators would probably answer "very little". And according to the following report they would be justified in this accusation. In a summary report *The Process and Product of T & I School Level Vocational Education in the United States: The Product*, "The rank order of sources reported by graduates to have influenced them in vocational course selection in high school, and the percent of students indicating each, are as follows: job opportunity, 43%; parents, 28%; friend of same age, 22%; books and magazines, 17%; school teachers, 15%; school counselor, 12%." These figures indicate that guidance counselors could be a much stronger factor in vocational decision making if they more adequately presented job opportunities.

The lack of adequate guidance in vocational-technical education appears to have been caused by a lack of communication between guidance counselors and vocational educators. It is the sincere hope of the author, that this report will serve to draw vocational educators and guidance counselors closer together in order to better serve the total educational needs of all students.

The following recommendations and conclusions are based upon the total research efforts of this project.

1. *Guidance Counselors should be included on the staff of every vocational-technical school.*

This person should be capable of developing vocational guidance material for use by counselors in the participating school districts. He should be capable of establishing an effective public relations program, and should serve as a resource person for vocational orientation programs. He should assist the home schools in carrying out the student selection policy, and be directly responsible for the final selection of students. He should maintain close contact with business and industry in order to determine employer and employee needs for curriculum development, student placement, and counseling. He should maintain a constant follow-up of all graduated students to determine their progress and to secure information from them relative to the effectiveness of their vocational school training. He should perform all the other services normally associated with guidance such as individual counseling, testing, referrals, parental conferences, development of effective permanent records, and information and guidance on advanced schooling.

This guidance coordinator should be selected on the basis of his ability to perform the above services. Business or industrial experience should not be a prerequisite for employment in a vocational-technical school.

2. *Vocational-Technical schools should provide appropriate vocational education for the bright as well as the dull.*

The problem of the school becoming a "dumping ground" can be avoided through effective guidance services. Thus schools which are able to offer students a choice of academic, business, and vocational-technical training should be meeting the educational needs of almost all secondary school youngsters.

3. *The vocational-technical school "image" should be improved.*

This can be accomplished to a large extent, by the presentation of accurate, up-to-date information on opportunities available through this form of education.

The logical person to assume this responsibility is the guidance counselor in the vocational school. All forms of communication media should be utilized in the dissemination of this vocational information.

4. *A good vocational-technical school "image" will be dependent on good public relations.*

It would appear that the most successful vocational schools, are those which have the best, most insistent, programs of public relations. Public acceptance appears to vary with public knowledge.

5. *Vocational-Technical education must be flexible.*

It must be capable of changing as rapidly as business and industry change. It must be capable of developing curriculums which take into account the fact that most of today's students will change jobs from three to six times during their working life. This means that the vocational school, even more than any other type of school, must be constantly experimenting.

6. *Vocational-Technical education must be continuous.*

Vocational orientation should start in the elementary school, and continue through the junior high school years. Vocational training should begin on the secondary school level, and also be available to all adults on a post high school level who are interested in vocational advancement or re-training.

7. *Vocational guidance must also be a continuous service available to elementary, secondary, and post high school students.*

Research on career development has proven that vocational guidance can no longer be viewed as a one time event. Every effort should be made to develop vocational materials which can be used on all educational levels. Guidance programs should then be developed to effectively utilize this material.

8. *Vocational education must more effectively utilize industrial arts and home economics teachers.*

These teachers are in a unique position to offer vocational orientation and counseling at a time when students must explore all possible alternatives in order to make intelligent vocational decisions. The ideal program would be to have all teachers use vocational information in conjunction with their subject matter.

9. *More effective use should be made of trade advisory committees.*

Those schools with the best employment records and the best public image also had the most effective system of trade and advisory committees.

10. *Every effort should be made to discover how vocational students differ from other students.*

These students should be tested, interviewed, and observed in an effort to develop objective criteria for use in counseling all students.

11. *Orientation programs should be developed which would enable interested students to take exploratory courses in the vocational-technical field.*

This is presently being done very effectively in summer programs.

12. *The term "job training for the non-college bound" should be dropped.*

Since many vocational areas require advanced schooling in junior or community colleges, the above term is no longer accurate.

13. *The vocational school curriculum should be geared to employment trends on a nation-wide basis and not confined to local industries.*

The need of local industries could be met through adult level programs. With the use of computers, information on employment opportunities anywhere in the country can be instantly available. Since our society is becoming more and more mobile, students should be made aware of all available job opportunities.

14. *More recognition should be given to outstanding vocational-technical school students.*

Vocational school achievement as well as academic achievement should be commended. This will serve not only as a motivational device, but also as a public relations release.

ORIENTATION

Education must constantly strive to make available to students the widest possible range of educational opportunities. With the development of Area Vocational-Technical Schools, this educational range is being increased. The problem now becomes, how can we help students make decisions? Since the primary purpose of guidance is to help people choose wisely from among the alternatives available to them, much of the help must come from guidance counselors.

Students who have inaccurate and limited knowledge of possible choices will make inadequate decisions. Thus the orientation of students will be an extremely important phase of any guidance program.

Many vocational educators feel that guidance services in the high schools have concentrated on students planning to enter college. In many cases this is true, but guidance counselors are not entirely to blame. Lack of adequate and accurate information concerning vocational-technical schooling is partly at fault. Colleges are constantly striving to present their programs in the best possible light. Their catalogs contain accurate information concerning the type of student who is most successful, information on why students are not able to succeed, and much additional information which a counselor can use to help a student arrive at a realistic decision. This information is presented in booklets of the highest quality of

paper, printing, and color photography. Thus when students read these catalogs they immediately form an impression of the school. The image a school projects begins with the presentation of its educational opportunities. The ease with which counselors can use this information in guiding students has been a contributing factor in the overemphasis on college counseling.

It must be remembered that counselors are not in the recruiting business, but they are constantly striving to accumulate information which can be used to point out to students all the possible educational alternatives that are available to them. Vocational education has not, as yet, done an adequate job of making available to students information on all the opportunities available through this type of schooling.

Since this report is primarily interested in guidance for vocational-technical schools, let's discuss how students receive information about vocational programs. A gross generalization would be that most students receive information through assembly programs. These programs are usually presented to 9th grade students, and in many cases 7th and 8th graders are present also. Thus a student may witness three assembly programs before he is asked to make a decision.

These assembly programs present information in a variety of ways. The program may be handled by the director of the vocational school, who talks briefly about the programs available and then may show a film. Some schools have made their own motion pictures. A very popular film available

through the Department of Public Instruction, is the Bucks County Technical School film. Some schools have developed a series of 35 mm slides which can be used to illustrate talks. Many programs feature discussions by the vocational instructors in various shops. Representatives from business and industry who are familiar with vocational programs, and who may have hired graduates from the school often speak in assembly programs. If the vocational school has a guidance counselor, he may present information which has been gathered by his office pertaining to the opportunities available through vocational-technical training.

Very effective programs have been developed which present vocational students. These students give their personal opinions of the school, and their reasons for selecting this training. For instance, a girl may appear wearing a cosmetology uniform, and if she speaks well and is enthusiastic about her work, she will do a great deal to motivate students to inquire further about the program. Keeping in mind the necessity to promote the vocational image, caution should be used in the selection of any speaker for a school program.

Naturally, assembly programs are not the only methods of orientation. Another source of information dissemination is the brochure or booklet prepared especially to present information on the various course offerings. These booklets are, in many cases, the sole source of information on vocational schooling. They are usually prepared by the administration,

and then produced by the students in the print shop. Some are very good, but most of these booklets present a poor and inadequate summary of vocational education. When drawings are included from the commercial art department, if carefully selected, they are an asset. However, the formats of these books are usually poorly done. If the information was augmented by counselors in group guidance classes and individual counseling sessions, it would probably prove sufficient. However, this does not appear to be the case. In most cases the vocational school bulletin becomes the sole source of information and many students, in conjunction with their parents, make decisions based upon information presented in vocational school publications.

The logical argument against improving the quality of vocational school bulletins is expense. Printed material costs money. Therefore if printed communication is limited, guidance counselors must assume a larger share of the responsibility of informing students of vocational-technical school opportunities.

With the improvement of vocational school communications, other school departments may become alarmed. The business department, for instance, may claim that vocational educators are using undue influence in an attempt to recruit students. This is a normal reaction. On the other hand, it just might stimulate every department to do a better job of

orienting students. Most counselors would probably welcome some competition in orientation in order to more effectively present the myriad of opportunities available to students today.

Getting back to vocational school publications, how do they compare with college publications? Do they tend to perpetrate the myth that colleges prepare first class citizens and vocational education trains second best? The hierarchical arrangement of jobs by perceived prestige and status levels should be constantly discouraged. Guidance counselors and other teachers who tend to perpetrate this thinking by demeaning vocational education are examples of our failure to eliminate faulty thinking even in educators. This is not an argument to upgrade vocational information in order to influence students to select this training over college, it is merely an observation of how the overemphasis on college level jobs has caused students to make unwise decisions.

If success in counseling would be measured by the number of students who start four-year colleges and then drop out, we would have to conclude that we have not done a very good job. On the other hand, if some of these college dropouts had arrived in college through another route, maybe these statistics might change. For instance, many students interested in engineering become discouraged in their first two years of college because the work is predominately liberal arts. They are, for the most part, mechanically inclined and anxious to do this type of work. Some schools are beginning to realize this, and now offer the mechanical phase first and the

liberal arts phase later. When this is done the student is immediately immersed in the type of schooling he wants. After two years, he is more mature and more capable of handling the liberal arts phase of his program.

This same process has occured with some students who arrive at advanced schooling through vocational-technical training. A gifted student may be bored with book learning, he wants to become physically engaged in some form of schooling where he can see tangible results. After two or three years of this training, he now realizes that advanced schooling is necessary if he is to continue to progress in his chosen career. This type of vocational maturation is far more effective because it deals with concrete experiences as opposed to vicarious experiences necessary in the academic curriculum.

Another form of orientation is the guided tour through the vocational school. Although this is done in many schools, a lack of time prevents students from adequately understanding vocational programs. A half a day or a whole day is not enough time. To make adequate use of this form of orientation, it should begin in the elementary school. Vocational information should be presented on the elementary level. Discussion of training for various occupations could logically lead into a tour of the vocational-technical school. During junior high school group guidance classes, another tour could be arranged. Finally, a 9th grade tour prior to course selection time.

In order to keep all educators cognizant of vocational opportunities, tours should be planned for teachers, administrators, and counselors. Parents and interested adults can tour the school facilities during open house programs. Counselors from participating high schools should be encouraged to visit the school monthly. Talking to students from their school will help to keep counselors informed of all aspects of the vocational-technical program. Talking to vocational instructors will give counselors insight into the type of student who benefits most from this schooling. The reverse is also true, students who are least successful can be more readily identified.

It would seem that we are unduly emphasizing tours as a means of orientation, and yet, this is only a part of the total picture. As the counselor in the vocational school develops information, these facts can be displayed in a prominent place in each shop, and can be easily assimilated by touring groups. Likewise the instructors can develop a thumbnail sketch of the general purpose of his particular trade for presentation to these interested groups.

Getting information to adults is sometimes very difficult. Every effort should be made to develop a program of information dissemination. The counselor within the vocational-technical school should become a public relations expert. Since his job is to collect and distribute information, he is the logical person to coordinate these activities. He should make it a point to present information about the school

to all service clubs and other interested organizations on a yearly basis. He should encourage the P.T.A. to have a program each year on some phase of vocational schooling. An open house program, if well-planned, could be an excellent means of telling the vocational story. Frequent and well-written articles explaining various programs within the school should be developed for use in local newspapers. Radio and T.V. programs should also be developed for use from time to time.

In establishing a guidance program for the Carbon County Area Vocational-Technical School, the author of this study prepared 16 articles for newspaper publication. Six five-minute T.V. programs, utilizing 35 mm slides, were developed for presentation over a six-week period. Four radio interviews were presented, and ten one-minute spot announcements were written and taped. These spot announcements were played at different intervals during the day for a one-week period. One issue of a local T.V. programming paper was devoted to the Area Vocational-Technical School. This paper is delivered to 5,700 families within Carbon County. It would appear that the total coverage, radio, T.V., newspapers, service club talks, P.T.A.'s, and adult programs would be such that most citizens of this area would be adequately informed. Although we have not made a survey, we know judging from the type of questions being asked, that many people are still either misformed or not informed at all. Thus the orientation program must constantly make use of all means of communication in order to keep accurate,

up-to-date information continually before the public.

Some vocational schools have developed monthly newsletters to keep students, teachers, and counselors continuously up-to-date on vocational information. This serves as a constant reminder of the many opportunities available through vocational training. This news media can be developed into a very effective form of communication.

Once a school is established, the vocational students themselves will serve to inform teachers and most especially other interested students. Youngsters tend to accept the judgments of their peer group much more readily than adult guidance. If the programs are good, and the students well-trained, job placement is facilitated. Information on job placement and starting wages will travel very quickly through the participating school districts. Much of the success or failure of the school is determined by the opinion of the students in the vocational-technical school.

In order to adequately inform students of the tremendous changes taking place within the world of work, group guidance classes to study vocations is extremely important. Vocational information should also be available on an elementary level. More and more schools are realizing the necessity for elementary school guidance. Elementary guidance counselors, working in conjunction with senior high and vocational school guidance personnel, could develop a program which would progress from elementary to junior high school, and hopefully continue on past high school to a post high school level. By the time a

student reaches the end of 9th grade when he must decide on the course he is to pursue for the next three years, he will have had an opportunity to study all possible alternatives available to him.

Group guidance classes in 9th grade could be a culmination of many of the guidance activities begun in the elementary school. The use of the General Aptitude Test Battery as a method of motivating students to analyze themselves in relation to vocational aptitudes should be part of the program. The interpretation of test results can be explained in more detail in a guidance class than in individual counseling sessions. In fact, individual counseling can be much more effective when students have been given preliminary information in a class session.

The use of interest inventories will also stimulate vocational planning. According to Dr. Leona E. Tyler, "The research carried on with interest inventories has made it more and more evident that this test is an extremely useful tool for assessing aspects of a person's total motivational pattern that determines what kind of occupational situation he will find congenial." (A more detailed description of the use of tests will be found in the testing section.)

The use of home economics and industrial arts teachers to help in the dissemination of vocational information should be thoroughly explored. Vocational information could be developed as an intregal part of these curriculums. These

teachers are in a unique position to present occupational information in conjunction with their teaching. Many teachers, and home economics and industrial arts teachers in particular, are in a position to offer vocational orientation and counseling at a time when students are beginning to develop a more intensive interest in various forms of work. Vocational education is actually an extension and intensification of many of the principles taught in industrial arts programs. What better way could these industrial arts principles be taught than to have available in a nearby vocational-technical school, training facilities that could be explained as the extenuation of much of the same training received in industrial arts. Vocational education and industrial arts mutually enhance each other and should strive to work cooperatively.

The Girard College School in Philadelphia has an ideal vocational orientation program. Beginning in 6th grade, students are given a semester of each of the vocational courses available in the school. This enables a student to get first hand experience in all available trades. Upon completion of the 10th grade, students then select the area in which they will specialize. Half of the student's time, during the 11th and 12th grade is then devoted to training in his chosen occupation. Girard College is not a public institution and is therefore unique in this form of educational planning.

The Sussex Vocational-Technical Center in Delaware is an example of a good program of vocational orientation in a public school system. Seaford High School, which is one

of the participating schools, begins group guidance classes in 7th grade. Classes are held daily for a six-week period. During this time, students receive information on jobs and material on course offerings at the Vocational-Technical Center. Group guidance classes continue in the 8th grade. A motion picture, which was made at the vocational school, is shown to all students. During this six-week period students are given tests and continue studying vocational information. In 9th grade, all students are counseled individually. Students selecting the vocational-technical program then spend a day visiting the school.

A summer program for orientation and course placement is available for a six-week period. Students are encouraged to enroll in this program, but it is not mandatory. Students rotate through six to eight shops, spending approximately five one-half day periods in each area. All participating schools give the General Aptitude Test Battery to 9th grade students. These results, plus the results of additional tests, are available and are used to counsel all students. Mr. Irvin Wheatley, Director of Guidance at Seaford High School, serves as the guidance counselor for the summer orientation program. Thus, he is familiar with guidance procedures and capable of interpreting all test results to each student.

Another orientation program of merit was developed by the Williamsport Technical Institute which is now the

Williamsport Community College. This program, known as the Vocational Diagnostic Program, was initially designed for the physically handicapped. However, the program has expanded and now includes services for anyone interested in a vocational-technical program. The program consists of four weeks of intensive counseling, testing, and trial shop work. A tuition fee is charged for these services, which are offered on a post high school level. This type of student evaluation and program orientation utilizes work experience or job trial methods which are similar to the Girard College and Sussex County programs. These programs are quite comprehensive in scope and could serve as models in the development of orientation programs for vocational-technical schools.

All three orientation programs described above utilize trial shop experience. This is certainly the best method for effective decision making. It would appear that in order to incorporate trial experience into vocational-technical school decision making, the program would have to be done in the summer. If vocational educators were hired on a ten or eleven-month basis, this orientation program could be accomplished in the same manner as that presently being done in the Sussex County School.

According to Mr. Grant Venn in *Man, Education, and Work*, "Sound occupational choice is made in direct proportion to information, guidance, and opportunities available to the

individual." The principle of sound occupational choice is the raison d'etre for guidance in vocational-technical education.

STUDENT SELECTION

Each vocational-technical school and comprehensive high school has developed its own procedure for student selection. No two schools are exactly alike. In some schools, the director makes the final student selection. These directors feel they are better qualified than anyone else to select students. They have established criteria, based upon their years of experience, which they feel is equal or superior to other methods of selection. Much of the evaluative criteria used by these directors is highly subjective. However, it must be noted that no selection procedure is entirely valid. In fact, if the sole factor in selection were I.Q. tests, it may well be that this method would correlate just as highly with eventual job success as any other method.

When directors assume the responsibility for determining which students will benefit most from vocational training, there is a tendency to eliminate many students with poor discipline records and below average intelligence. Directors can very well justify this line of reasoning. Students who are discipline problems could endanger their own life and the lives of their classmates in this type of schooling. The factor of intelligence is justified by the statement, if the student cannot satisfactorily complete the course, he cannot be placed in a job for which he was trained -- a primary purpose of vocational education.

It must be remembered that vocational educators need students to justify their programs. Thus, most students who show an interest in vocational schooling are accepted. The actual selection process is primarily centered around two or three courses which prove to be extremely popular. If 50 positions are available for cosmetology, and 80 students are interested, how do you determine which 50 students would make the best cosmetologists? There are no standard tests. What do you use? Artistic ability? Neatness? Personal cleanliness? Interest? Grades? Teacher recommendations? A trial period? These problems remain to be solved. Guidance counselors who are highly trained to evaluate student ability, would be the first to confess a lack of adequate criteria. However, guidance counselors working in conjunction with vocational educators are in a much better position than anyone else to determine selection procedures.

Many vocational schools let the orientation and selection of students up to the participating schools, but reserve the right to accept or reject any student. Guidance counselors in the home high school then become responsible for student selection. This method has proven unsatisfactory because most counselors do not believe that they have sufficient objective criteria to justify selection. They counsel students, but they do not make decisions for them. Vocational educators are beginning to realize that a guidance counselor in the vocational school, to act as a coordinator with guidance

personnel from the participating school, will facilitate information needed to help students make realistic decisions.

A guidance coordinator, working with counselors, can help to establish orientation and counseling procedures which will prevent student selection from becoming a major problem.

Let's assume that students are effectively oriented. They know what courses are available, they understand all possible alternatives, and they have evaluated their abilities. They are now counseled and made to realize that some vocational courses, such as auto mechanics, tend to have more students than positions. They are asked to evaluate a second and third vocational choice in the event their first choice is not available. When this procedure is followed, students tend to be much more realistic in their course selection. The question still remains, however, what do you do with students who have gone through this process and certain courses are still overcrowded? Obviously someone or some group must decide which students can be accepted and which students cannot. Let me repeat that there is no objective criteria which is 100% valid. However, the final decision should be the responsibility of the vocational school. The guidance coordinator, after conferring with the home school counselor and the student in question, should make the decision. This will enable the vocational school counselor to select the best qualified students after examining the qualifications.

of all students from the participating schools.

One school has set up arbitrary cut off points on three tests which they consider to be relevant. All students must have a minimum I.Q. of 85. They must also score above the 35% on the Bennett Mechanical and the Minnesota Paper Form Board Tests. Naturally, the percentage of students who would score below these levels would be extremely small. This selection procedure has apparently not been highly successful because this school now accepts as many students as possible, and then the student either makes the grade or is returned to the home school. No figures are available to substantiate their selection procedure based on these tests. When test scores are used, local norms should be developed to validate the use of the tests.

A number of factors have been developed for use in student selection. Heading the list would be standardized tests. (Testing is dealt with more extensively in another section of this report.) There is no general agreement on exactly what tests should be used. Many vocational educators feel that a high percentage of student failure is due to reading deficiencies, and would therefore recommend a reading test. Some feel an I.Q. test would be sufficient since, as a rule, the higher the I.Q. the greater are the chances of success in vocational training. Although there are numerous aptitude tests available, the results of these tests are used less frequently than one would expect. And yet, it would appear

that aptitude tests offer the most hope for the development of objective criteria. Interest inventories are used even less frequently than aptitude tests. This is explainable, and yet, vocational educators feel that a strong interest is, many times, the most important factor to be considered in selection. Achievement test scores are only used in conjunction with other tests and would not be considered as an important selective device.

Another factor used in judging students is scholastic performance from the elementary school up until the end of 9th grade. Greater emphasis is usually placed on achievement during a student's last three years.

A third factor is a student's interests, activities, and hobbies. A boy who is seriously contemplating a career in electronics usually has developed his interest to the point whereby his leisure activities tend to include some form of electrical or electronic activity. However, some hobbies may be misleading. For instance, most boys are interested in cars and many have jalopies which they are continuously tinkering with. A few of these boys may want the auto mechanics course in order to learn enough to keep their car on the road. Therefore, when interest is used as a selection factor, counselors should determine the reasons for the interest. Interests determine motivation and should be evaluated carefully. As an example, many students develop interests based on environmental opportunities. Their parents fish -- they

fish. Their mother wanted to be a nurse so the daughter hears only the virtues of nursing. What about data processing or welding? How does a student develop an interest in these areas if he or she is completely oblivious of their existence? As educators, we owe it to students to do everything in our power to broaden the base of a student's thinking. We should give them a bird's eye view of the world, not a worm's eye view. The point is, interests can be misleading.

The recommendations of various teachers is another factor used in selection and one which could be very effective. The inclusion of teachers tends to foster the idea of vocational education being an intregal part of academic education. It also helps to make teachers realize that guidance is not the sole responsibility of the counselor. Teachers might also become more cognizant of the interdependence of education and work. This statement has been made elsewhere in this report but it bears repeating -- our society is rapidly approaching the time when education and work will become synonymous. The industrial arts teacher and the home economics teacher should become key people in recommending students for vocational-technical training. Their services should also be solicited for orienting students.

Student discipline and tardy records are factors which cannot be overlooked in student selection. The safety factor in vocational education necessitates screening all applicant's behavior records. If a student has a record of an emotional

disorder, this must be noted and investigated. A student's attitude is always an important consideration in any selective process.

The attendance record of a student is also considered. Poor attendance is usually a sign of poor health or an emotional problem. If a student is sickly, certain forms of vocational training could be a health hazard. Poor attendance for other reasons is usually indicative of poor adjustment and should be carefully studied. A student who is faced with constant failure in school may feign illness to escape reality. On the other hand, this same student may be vocationally talented and success in the vocational school could serve to rehabilitate him.

All of the above factors are used in part or wholly as criteria for admission to vocational education. Each factor, considered individually, could be questioned, and proven to be inadequate as a predictor. However, when all factors are considered together, the weakness of one is offset by the strength of another. When all factors are considered, the selection procedure maintains a flexibility which prevents many of the errors of a rigid set of standards. Guidance counselors, like vocational educators, want all students to have an equal opportunity in selecting educational training. If students are adequately informed and given an opportunity to select from a wide variety of alternatives, vocational education will never lack students.

The philosophy behind the selection process in one school was summarized in two questions: (1) will the student benefit from vocational training, and (2) can he or she be trained to a level of competency to insure employability? Depending on the reader's frame of reference, this first question could be interpreted somewhat differently. To a vocational educator the interpretation might be quite simple. To determine whether the student will benefit from vocational education would depend on his interest, his ability to complete the course, and his eventual placement in a job. To a guidance counselor the question becomes much more complex. Guidance today does not limit itself to the classical concept of matching youth with jobs and disseminating information. Guidance counselors are concerned with theories of vocational development and with self concept theories relative to this development. Counselors are interested in the type of person that evolves through educational experiences. They are interested in a student's values and needs as well as his vocational abilities. Perhaps guidance is trying to bite off more than it can chew. Perhaps we are underestimating the sensitivity and perceptiveness of vocational educators. The point is, however, that the selection process to a guidance counselor is a much more involved process and his concern is heightened by the fact that the extensive use of the subjective evaluations means someone is playing God.

The following is an outline of the student selection policy adopted by the guidance counselors in Carbon County.

I. *Orientation:*

A. The home school will be responsible for the orientation of students, parents, and teachers.

1. The Area Vocational-Technical School staff will assist in this program in any way possible.

II. *Student Application:*

A. Students interested in vocational-technical school training will file an application form with the Guidance Counselor in his or her home school.

III. *Counseling of Students:*

A. After students have received as much vocational-technical school information as possible, they should be counselled individually.

1. When talking with students, counselors should keep in mind areas which tend to become overcrowded and also the following factors.

IV. *Factors Used in Student Selection:*

A. All students must have completed 9th grade.

B. All students must be at least 14 years of age.

C. Physical defects must be noted.

D. Academic record will be a factor.

E. Discipline record will be noted.

F. Attendance and tardy record will be considered.

G. Appropriate test scores will be a factor.

H. Recommendations from various teachers will be helpful.

I. Acceptance of all students will be on a provisional basis for the first semester.

V. After completing the first four steps, counselors will then submit all final application forms to the Area Vocational-Technical School.

A. Students will then be grouped according to their first choice.

1. If no areas are overcrowded, all students will be placed in their first choice.

B. The records of all students in overcrowded areas will be examined.

1. Those students who are obviously the best qualified will be accepted first.

2. Questionable cases will be discussed with the home school counselor.

3. Every effort will be made to maintain a balance of students from each of the schools.

TESTING

"Tests cannot measure vocational ability as well as an all-out exploratory program of work projects. The result of real work is certainly more indicative of skill than is the score on a scaled-down artificially contrived paper test. However, if intensive vocational shop tryouts are not available, the next best guidance tool is testing." This statement, by Dr. Franklin J. Keller, summarizes the authors feeling concerning testing for vocational-technical schools.

Tests can be extremely useful guidance instruments. Where testing fails, the failure is usually due to faulty test interpretation rather than to the validity of the test. Tests are based on statistical concepts which should be thoroughly understood by the interpretor. This understanding is essential when tests are used as predictive devices. A good example of the use of statistical concepts in prediction is that used by the weather bureau. When meterologists use instruments to measure various atmospheric conditions, the results are gathered together and interpreted in order to predict the weather. They are guessing whether it will rain or not, but they are educated guesses based on their test results. Their tests are not 100% accurate and thus they make mistakes. However, they absolve themselves of criticism by predicting according to a statistical concept upon which all tests are based. Weathermen no longer say it will rain or it

will not rain; they say there is an 80% probability of rain tomorrow. Thus, if it does not rain, the answer can be found in the fact that for every five days in which the same atmospheric conditions exist, in one of these five days it will not rain. In other words, tests increase the number of times the prediction will be right. It does not make one infallible.

Although tests are frequently used as predictors, a far more important use of tests is for descriptive purposes. A student must know something about himself in order to make a decision. How much ability do I have in comparison to the people I will be competing with to get an education or a job? If I want to be a welder, how do my abilities compare with people who are successful welders? Describing to a student how he compares with other people, also affords the counselor an opportunity to explain the uniqueness of each individual. In order to choose wisely among all the vocational alternatives available, a student must know how he is like other people, as well as how he differs from other people. Accurately interpreting this information to students is a vital function of any guidance program.

Tests are developed as scientifically as possible. They are objective criteria which, when used in conjunction with other student evaluations, enable competent users to help students make wise decisions. They have proven to be far superior to subjective evaluations and their use will

help in making vocational schools more efficient.

Let's discuss first what tests are being used and how. Most vocational schools have access to a student's permanent record card on which are recorded all test results since a student entered school. The person in the vocational school responsible for selection, counseling, and placement, should make use of all available information on each student. The more information available the more effective is the counseling.

I.Q. tests should never be used as the sole criterion for any purpose of prediction. All the vocational schools visited had access to I.Q. scores. These tests included the Otis, California Mental Maturity, Lorge Thorndike and Henmon-Nelson. When I.Q. scores are used in conjunction with other evaluative criteria, the non-verbal I.Q. may be more appropriate for vocational education than the verbal score. If the I.Q. test scores were the only basis used for selection, and it is questionable that this has ever been done, the odds would naturally favor more successful predictions for higher level I.Q.'s. However, studies indicate that talent and creativity cannot be measured by I.Q. tests. These tests <u>alone</u> should not be used to measure acceptability.

Achievement tests are useful to help formulate an accurate picture of a student's development, but are little help as a selective device. One school, because of a lack of time, used three basic test results; one of which is an I.Q.

and the other two are achievement tests. No aptitude test is administered and the interest inventory is optional. Needless to say the students are being short changed in this program. In 1962 when Dr. Keller completed his study of 100 vocational-technical schools, 49 of these schools were giving no tests at all for admission. It would probably be much better to eliminate tests, than to attempt to give vocational counseling with only I.Q. and achievement test results available. Vocationally-talented students cannot be identified with these instruments.

The intelligent use of aptitude tests should be part of any comprehensive testing program. A number of excellent aptitude tests are available for use in vocational counseling. The Differential Aptitude Test measures verbal, numerical, abstract, spatial, mechanical, clerical, grammar, and spelling aptitudes. Ease of administration has encouraged a wide-spread use of the DAT. Most vocational schools who use this test, are more interested in mumerical, spatial, abstract, and mechanical scores than the other three. When this test is used in conjunction with an interest inventory, students are motivated to analyze their abilities and interests as they relate to various kinds of jobs. For instance, a student may score high in mechanical aptitude as well as mechanical interest. With this information, he begins to realize that here is an area in which he has more potential than most people. He knows that, with adequate training, he could probably excel in this

field. Without an aptitude test, he might never have realized he possessed this potential. According to Dr. Donald E. Super, in his critique of the DAT, "Its occupational norms and validity data are still too limited; however, for it to be used with confidence for differential vocational prediction or counseling."

The General Aptitude Test Battery measures intelligence, verbal aptitude, numerical aptitude, spatial aptitude, form perception, clerical perception, motor coordination, finger dexterity, and manual dexterity. The GATB norms are expressed in terms of occupational aptitude patterns. Each pattern consists of the cutting scores (minimum scores) established for each of three key aptitudes required by a job family of similar occupations. Pattern three, for example, consists of G - Intelligence, N - Numerical, and S - Spatial aptitude with minimum scores of 125 on G, and 115 on N and S. Occupations covered by this pattern are Laboratory Science Work, Engineering and related jobs.

Some 36 occupational aptitude patterns have been developed so far, and research is constantly being done to keep up with changes due to technological advancements. This permits students to view their aptitudes in terms of broad groups of occupations rather than in terms of individual occupations. This inherent flexibility allows students to explore many different job possibilities.

Norms on the GATB are now available for 9th grade students. These youngsters, who must make a tremendously important educational decision, have only a vague, unstructured idea of various courses of action. They need to know what their limitations are. Ann Roe has stated, "The high school norms for the GATB should be of considerable value. For example, when a 9th grader is trying to decide whether he should head toward college or toward a technical school, we ought to be able to make a prediction about where he is likely to stand in comparison with other applicants for technical schools in the abilities required there, as well as to predict whether or not he will qualify for college." She also points out, that accumulation of minimum scores would facilitate decisions as to the probability that a student could qualify at all for a given occupation.

Many students in 9th grade need help in the location and formulation of promising courses of action. They need a device which gives them a realistic framework in which they can operate. The GATB helps a student discover what his occupational limitations are.

Dr. Gene Bottoms, Georgia State Supervisor of Vocational Guidance, who is presently working on a more extensive but similar research grant, has developed statewide norms based on the Dailey Vocational Tests. These norms are presented in a booklet entitled, *Counselor's Guide to Georgia Area Vocational-Technical Schools*. After students have taken the

aptitude tests, the results are explained to them by counselors with the use of this booklet. For instance, a student interested in electrical construction can compare his percentile rank with that of other students presently enrolled in Vocational-Technical Schools.

Dr. Bottoms points out that the Dailey Vocational Tests are not designed to become an admissions instrument. Most of the schools plan to continue their use of the GATB as their selection criterion. The development of norms for the Dailey Vocational Tests has been done primarily to assist students in selecting the course to be pursued. Examination of the content of the Dailey Vocational Tests and the GATB indicates that the two are related and there should be little conflict between scores made on the two tests.

Georgia has made tremendous strides in up-grading the image of vocational education within the state. They have collected information on industrial and business opportunities available through vocational training; they have done follow-up studies on graduates; and then presented this information by means of high quality booklets, posters, filmstrips, T.V. programs and newspaper releases. They feel that students have not been adequately informed of vocational-technical school opportunities, and that much of the information that had been available was poorly presented and of inferior quality in comparison with communication publications by colleges. By improving their communication media, they have improved the vocational school image, and increased enrollments.

No attempt was made in this study to thoroughly investigate all available aptitude tests. Only tests presently being used in the schools visited were seriously considered. However, information on aptitude and other tests, supplied by the *5th Mental Measurement Yearbook* by Buros, and *The Use of Multifactor Tests in Guidance* by the American Personnel and Guidance Association, were carefully studied.

The GATB was felt to be the best aptitude instrument for use in orientation and selection of students to attend Area Vocational-Technical Schools. The specific use of this test battery is explained in part II of this report under, Testing for the Carbon County Area Vocational-Technical School.

Of all the testing instruments available, interest inventories and personality tests are the least reliable. However, research indicates that interest inventories may be useful for assessing certain aspects of a student's total motivational pattern that determines what kind of occupational situation he will find congenial. Much of this research has been done on the Strong Vocational Interest Blank. This instrument has proven to be the best device for measuring interest. Its use on a 9th grade level, however, would be limited. It is difficult to score and it is geared primarily to professional and managerial level jobs and does not have relevance for non-college students.

Another fundamental weakness of interest inventories is the fact that they tend to perpetuate the status quo. Norms are established to indicate how students resemble present workers. This disqualifies students who may be innovators. A student who varies from the established norm for a certain occupation could possibly possess motivation which cannot be measured by present testing devices. The fact that student interests are developmental in nature is likewise not measurable by today's interest inventories. The growth of interest, like career development, is extremely difficult to ascertain through testing. Tests describe how an individual reacts at the time of testing, but its predictive value is lessened because of the constant growth of the student.

With these thoughts in mind, let's consider the possible uses of an interest inventory. The Kuder Vocational Interest Inventory measures nine areas of interest. It can be used as a tool to help students in 9th grade structure their thinking about occupations. The D.O.T. has well over 20,000 job descriptions. What method should be used to study job opportunities? One suggestion would be to use the GATB as a motivational device to stimulate occupational thinking. This has been explained in the Carbon County Area Vocational-Technical School guidance program. Another device for motivation could be the Kuder Vocational Interest Inventory. When this instrument is used in a group guidance class, where its limitations can be explained before the results are interpreted,

it can serve a very useful purpose. For instance, negative results on the Kuder have been found to be more indicative of occupational dislike than positive results are for like. Thus, by a judicious use of results, a student can begin to narrow down his occupational exploration without fear of an excessive limiting of his possible alternatives. Occupational exploration must begin somewhere, and interest is a proven factor in job satisfaction success.

The Hackman-Gaither Interest Inventory is a more recent interest measurement and could be used as well as the Kuder. Since both these instruments are easily administered and scored, the choice is up to the discretion of the counselor.

All tests can be classified as intelligence, achievement, aptitude, interest, or personality. For counseling purposes, the more test results available the more accurate the decision process will be. Therefore, counselors should have available a complete, up-to-date testing record on each student. However, it would not be necessary to have 9th grade test results from each of these five areas, unless for some reason, a student would have no test record at all. Only two testing areas are recommended: A multifactor aptitude test and an interest inventory.

Personality tests are less valid than any other test and appear to have little use in vocational counseling at the present time. However, a student's personality is definitely a factor in educational and vocational training.

Students training for jobs in the service areas, where they are required to meet and deal with the public, must possess certain personality traits. If these traits could be accurately measured by a testing device, it would be extremely beneficial. The author has used various personality tests in 8th grade group guidance classes, but they have proven to be of little value except as a catalyst to stimulate thinking about mental health. As these tests become more valid, they will serve a useful function.

PLACEMENT

The placement of vocational-technical school graduates into business and industry is done in a variety of ways. In many schools, placement is done almost exclusively by the individual shop instructors. These schools feel this enables the teachers to keep abreast of industrial changes. It also affords instructors the opportunity to check on graduates. If previously placed graduates are not measuring up, the instructor receives this information directly from the employer. This constant contact with industry provides the stimulus to keep programs up to date. One school system felt that the industry-teacher relationship was important enough to warrant the hiring of a floating teacher. This enables each shop instructor to spend one full day every three weeks in industrial visitations. When industry is kept informed of educational programs, they are quick to get in touch with the school when various jobs need filling. Instructors know their students better than anyone else. If they are completely honest with employers concerning a student's accomplishments and potential ability, they can develop a harmonious working relationship with industry.

Accurate records should be maintained on each student. These records should indicate a student's achievement as well as his attitude, attendance, and growth potential. For the student's sake as well as the employer's, honest evaluations should be given during placement.

In another school, placement is done almost entirely by the vocational school counselor. Recommendations from shop teachers are given to prospective employers by the counselor. Valuable information is obtained by the counselor in his contact with industry which enables him, like instructors, to keep abreast of industrial changes. This information is necessary for more effective counseling.

In the majority of the schools visited, placement is a cooperative procedure between the guidance counselor, the State Employment Service, and the vocational school instructor. This system enables instructors and counselors to enhance their background information, and at the same time make use of the industrial contacts developed by the employment service.

It would seem that this last method of student placement would be the most effective for all concerned. It enables counselors and instructors the industrial contact necessary for better teaching and counseling, and it utilizes the resources of the Employment Service. No school could possibly duplicate the vast amount of material and contacts available through the State Employment Office. With our highly mobile society, these services are being extended to serve the country as a whole rather than a local area. Eventually, the Employment Office will have available job statistics from all parts of the country. A student completing a course in chemical technology in Pennsylvania may decide, because of the availability of jobs, to

work in California. When we begin to take a more universal view of job opportunities, training courses can become more extensive. Vocational training should not be limited to jobs available in the immediate area, it should offer courses which are in demand throughout the country. This information can be given to students to enable them to make a decision based on their abilities and interests, and not solely upon job openings in the immediate vicinity of the school.

Job placement is a primary concern of vocational-technical education. If students are unable to obtain satisfactory working positions, vocational school training becomes worthless. However, career development is a continuous process, and in the future, job changes will become more prevelant. Many students will change jobs from three to six times in the course of their working life. Thus, vocational education should not be judged successful or unsuccessful according to the number of students placed in jobs for which they were trained. According to Dr. Donald Super, students will go through various stages in their career development. The stage at which they tend to maintain the work they are engaged in does not come until the worker is in his late twenties or early thirties. Students completing vocational school training at the age of 17 or 18, cannot be expected to enter and remain in the job for which he or she was trained. To use initial job placement as the sole criteria of vocational school effectiveness if unrealistic.

To some students this training may have a negative effect. That is, they may decide after completing the training that this is not the type of work they want to do. They may go into a related line of work or they may take additional schooling for completely different work. These students have grown through their experience in the vocational school. They have not been poorly counseled. They have used their educational experience to arrive at a more mature decision.

Fortunately, most students, by means of vicarious experiences, are able to arrive at adequate vocational choices. The constant development of materials which can be used in decision making should be the goal of all educators. The integration of vocational development with academic development will help in the decision-making process.

STUDENT FOLLOW-UP

In order to ascertain the effectiveness of any program, follow-up information is necessary. This information can then be used in counseling students, in curriculum adjustment, and for developing more effective orientation programs.

All of the schools visited agreed that information on graduated students, who have been out of school for awhile, would be extremely beneficial. However, most of these schools have been unsuccessful in obtaining this information. They do have information on the status of students who have just graduated. This information is necessary to complete a form required by the State. Thus, information such as the number of students entering jobs directly or indirectly related to training is available, and also the number of students who enter the Armed Forces or get married. This type of information is good. However, in order to get maximum usage of follow-up data, the disposition of students after one year, three years, and five years is necessary. Realizing this, most schools have attempted at one time or another, through questionnaires, to obtain this information. Returns are usually so poor that these schools feel the results are not valid. The problem becomes one of developing methods of getting better returns on requested data.

Various methods have been used to increase the returns on questionnaires. The most effective methods is the

use of a birthday card. Former students receive, on their birthday, a greeting card which serves a dual purpose. It is a personal birthday greeting and a request for information. If students are informed, while in school, of the necessity for this information, the returns are usually better. Thus orienting students, plus the use of birthday cards, has produced in some schools statistically usable returns.

What information is usable? Most questionnaires ask for the student's name, where he is employed, his rate of pay, kind of work, advanced schooling, whether he is in the Armed Forces, if so, what kind of work is he doing, etc.; and perhaps a request to evaluate his vocational school training. Some areas could be more detailed, but increasing the size of the questionnaire tends to decrease the returns. Basically, the information requested should be vocational in nature. The kind of job, the qualifications necessary, chances for advancement, hours of work, wages and potential increments, new methods of work not taught at the vocational school, etc. This data would be extremely helpful to educators as well as potential students.

Another method which could be explored for possible students' follow-up, is a form of newsletter. Since vocational schools will offer adult programs for the upgrading of job skills, as well as vocational courses, this information could be distributed in the form of a newsletter. An explanation of the need for follow-up studies could be briefly presented

along with a questionnaire. If the newsletter contains news of former students, it will more than likely be read and answered.

Follow-up studies have two major purposes: (1) to evaluate the effectiveness of the vocational education program, and (2) to maintain contact with previous students in order to obtain information about post-school history and to help students in their educational or vocational progress.

To summarize, follow-up information could be used in the following ways: (1) using the results for curriculum revision; (2) improving the guidance program, through a study of successful and unsuccessful cases; (3) helping previous students in need of further service; (4) studying selected groups of students (perhaps those scoring high or low on certain phases of an aptitude or interest test); (5) presenting information to incoming pupils about the post-school educational and work histories of previous graduates; and (6) interpreting follow-up data to the faculty so that they understand better what is happening to their students and are aware of the outcomes of the vocational-technical program.

It is recommended that follow-up studies be done on a one year, three year, five year, and possibly a ten year basis. Returns should then be constantly evaluated in light of increasing technological changes. (See Part II of this report for a sample follow-up questionnaire to be used by the Carbon County Area Vocational-Technical School.)

CARBON COUNTY AREA VOCATIONAL-TECHNICAL SCHOOL GUIDANCE PROGRAM

PHILOSOPHY

The guidance function is essentially one of helping people choose wisely from among the alternatives available to them. We do this by encouraging students to study themselves in relation to their present and future opportunities. We are less concerned with what students choose as we are that they have the widest possible range of opportunities from which to choose. As counselors we are not interested in making students decide, but in helping them arrive at realistic decisions. We are less interested in the something they become as the someone they become. Our primary concern then becomes one of helping individuals to make choices based on increased self and environmental understandings. If the guidance program is working properly, students in the vocational-technical school should be those students who have arrived at this decision after careful consideration of all available alternatives. We assume that these students are capable, with adequate counseling, of making rational decisions. Therefore, most students enrolled in vocational-technical education should be persons having reasonable chances for success in the curriculum of their choice.

A counselor's primary allegience must be to his counselee, not to vocational education. Vocational educators, as well as counselors, must have confidence that given adequate information

and time to choose from among alternatives, most students will choose wisely and sensibly. We must uphold the right of the individual to lead his own life and to believe that most individuals can and will accept the responsibilities which accompany this right.

A commonly held perception is that students should choose to do that in which he or she can be most successful. If we accept this perception, our country would be faced with a continuing under-development and under-utilization of talent in our society. Some students will elect the sure, safe route to success while others will select routes involving risk of failure. The counselor's function is not to arbitrarily decide that one decision is more desirable or worthwhile than another. Rather, the counselor should help the individual to fully understand the alternatives available to him. The final decision is made by the student not the counselor. Counselors must allow the risk function to operate without prejudging the desirability or lack of desirability of decisions students make with respect to the risks they are willing to take. Therefore, if the guidance program is successful, there will be some students in the vocational-technical school who are capable of successfully completing the most difficult academic sequence, and some students whose chances for successful completion of the course is questionable. However, most of the students who are enrolled will have a more reasonable chance of success in vocational education than they would have

in a highly academic curriculum.

If the only measure used to compare students in the college preparatory curriculum with those in vocational education is one which best predicts success in college (intelligence tests), then vocational education students would, on the average, be expected to score lower. Guidance counselors will realize this and need not apologize for it.

Another factor which counselors must consider is the rapidity with which our occupational society is currently changing. Young people need to develop flexibility in anticipating and meeting change. Counselors must discard once and for all the notion of vocational guidance as a single event at a certain stage in a student's life. The uncertainty involved in the constantly changing work roles will require an expanded program of guidance and counseling. Vocational guidance must be made a continuous process starting in early childhood and extending into the adult years.

Counselors must realize that work and education may soon be synonymous and that there is no dichotomy between a technical and a liberal education. There is no adequate technical education which is not liberal and no liberal education which is not technical. Education should turn out a student with something he knows well and something he can do well.

Vocational guidance and educational guidance are interdependent and mutually enhance each other. They are not at cross purposes. At the present time, there is a crucial

need for vocational education to really become a part of education and not apart from the rest of education.

ORIENTATION

The participating school districts will be responsible for the orientation of students, parents, and teachers. The Area Vocational-Technical School staff will assist in the orientation program in any way possible.

Guidance brochures will be available to explain the programs and policies of the school. Additional written material on specific courses is also available and will continue to be developed and disseminated to the schools as the programs develop. A regular system of communication will be developed to keep students, parents, counselors, and teachers constantly informed of the opportunities available in the Area Vocational-Technical School. Thirty-five millimeter slides are available depicting vocational-technical classes in operation. With the opening of school, additional colored slides will be made of all phases of the vocational-technical program.

Beginning with the school term 1966-67, guided tours of the school will be arranged with each home school. It is hoped that all 9th grade students in Carbon County will have the chance to see and hear the opportunities available in this form of education. These tours will not be limited to 9th grade. Junior high school students as well as elementary students will be encouraged, through tours of the vocational school, to learn more about the world of work. Guided tours for teachers

will also be arranged as part of an in-service training program. The success of vocational-technical education in Carbon County depends on well-informed educators -- all educators.

A similar program will be planned for all parents and interested adults. Orientation programs are not one time affairs. They must be continuous with a degree of flexibility that will insure their constant growth.

We feel students should begin their study of occupations on the elementary level. In order to encourage this, material will be developed for use in the elementary school. Additional material for the junior high school will be developed for use in the industrial arts and home economics curriculums. In order for this material to be used effectively, industrial arts and home economics teachers must be convinced of the educational soundness of this procedure. These particular teachers can contribute immeasurably to the tremendous task of orienting students to the myriad opportunities available to them through various forms of education. Let me emphasize again that intelligent decisions can only be made when the individual has had an opportunity to study all possible alternatives. This material will be developed and disseminated upon approval of all guidance counselors and subject matter teachers involved. It is hoped that this cooperative guidance project will serve as a motivating factor in the development of a truly comprehensive guidance program which will extend from elementary school through postgraduate training.

It is recommended that group guidance classes be established for all 8th or 9th grade students. This will enable students to systematically study all possible educational and occupational alternatives. It would also enable counselors to administer and interpret various tests such as aptitude, interest, and achievement tests. Having all students together as a group affords a counselor the opportunity to cover a great deal of information that could not possibly be dealt with in individual counseling sessions. When students have been exposed to all possible alternatives available to them, then individual counseling sessions will be much more fruitful.

As an intregal part of this group guidance class, it is suggested that the General Aptitude Test Battery be administered to all students. The interpretation of the results of this test could then be used as the motivating device to stimulate students to analyze their abilities in relation to the possible vocational opportunities available to them. This test would be an excellent device to generate interest in the study of occupations. The GATB covers all occupational phases from unskilled jobs up through those occupations which require a college degree.

It is estimated that man's knowledge is doubling every twelve years. In order to effectively utilize this fantastic growth in knowledge, the computer will become an absolute necessity. This knowledge explosion and the use of automated equipment is naturally affecting all kinds of jobs. One of the greatest obstacles facing guidance as it pertains to young people,

is how to adequately inform students of these tremendous changes. It cannot be done in individual guidance sessions. We must insist that students have the opportunity to systematically study the "world of work".

Upon completion of the guidance class, students will be required to make a decision concerning the curriculum they will pursue. At this time it would be advisable to counsel all students individually.

STUDENT SELECTION

Students interested in vocational-technical school training will file an application form with the guidance counselor in his or her home school.

The following factors should be used in counseling students:

1. All students must have completed 9th grade.
2. All students must be at least 14 years of age.
3. *Physical Defects* - Any physical defect must be noted on the application form. A physical defect will not necessarily prevent a student from attending the vocational-technical school, but must be considered in light of the student's chosen area. Note should also be made of any emotional history.
4. *Academic Record* - A student's academic record should be considered as it pertains to the specific area in the vocational-technical program the student wishes to enter. For instance, students with severe reading deficiencies would be handicapped in all of the technical courses and some of the vocational courses. Mathematical deficiencies would also be a handicap in many courses.

5. *Discipline Record* - The discipline record of a student will give evidence of present maturity, acceptance of responsibility, and respect for authority. These qualities are important for success in vocational-technical school training, and industrial employment. Lack of self-discipline could lead to behavior which would endanger the safety of other students.

6. *Attendance and Tardy Record* - Industry will not tolerate excessive absence or tardiness. Since the nature of the training program is for gainful employment, students must maintain a good attendance record. Failure to do so, could result in dismissal from the vocational-technical school.

7. *Test Scores* - All test scores given within the last three years should be noted on the application form. GATB test results should be used as a counseling guide. All other test results such as I.Q., achievement, interest inventories, special aptitude tests, and personality tests should be noted, but should not be used as the sole criteria for possible success in vocational education. A testing program will be developed within the vocational-technical school and local norms established. These test results will then be available to counselors for use as guidance tools.

8. *Recommendations* - Recommendations from various teachers will be extremely helpful in students selection. All students must be recommended by their guidance counselor. Other teacher recommendations that will be helpful are: industrial arts, home economics, art, math, and homeroom teachers.

9. *Acceptance* - Acceptance of all students will be on a provisional basis for the first semester.

Students will have the benefit of home school and vocational school guidance services. Periodic visits to the school by counselors will serve to keep counselors well-informed of all aspects of vocational training necessary for effective counseling. Course changes by students will be the responsibility of the vocational-technical school counselor. Problems arising

from students wishing to drop vocational training and return to the home school will be handled by the vocational school counselor in cooperation with the student's home school counselor.

TESTING

The use of tests as a guidance tool is a foregone conclusion. The question is, what tests and how do we use them?

The effectiveness of a test will depend on four basic characteristics: (1) description, (2) prediction, (3) timelessness, and (4) multipotentiality. A test must describe a student so the counselor can see him as he is at the time of testing. It must predict, as accurately as possible, what he will be like and what he may do at some future date. A test must also be timeless in order to be usable over a long period of time. And finally a test should be like the people it tests, multipotential.

Naturally, no test is 100% valid or reliable, but the more statistics that are available, the better counselors can judge validity and reliability. The most important feature of the General Aptitude Test Battery is the mass of data which has been accumulated. According to Dr. Lloyd G. Humphreys, Professor of Psychology at the University of Illinois, "Such data are of primary importance for selection or guidance purposes."

The GATB measures nine different aptitudes and has been completely factor analysized. It has been standardized on

the working population from professional level jobs down to unskilled jobs. Scores can be broken down into 36 occupational families with 806 related jobs.

The GATB is a complete testing program measuring general intelligence, math aptitude, reading ability, and mechanical aptitude. It is applicable for college bound students as well as vocational students. The goal of vocational guidance at the junior high school level is the broadening of occupational horizons rather than the premature narrowing of choices. Counselors should strive to maximize the individual's potentialities rather than merely screen him in relation to a few requirements. Students should be provided with a broad career orientation program in the 8th or 9th grade in order to facilitate the making of specific curricular choices required by our educational system.

According to Dr. Donald E. Super, Columbia University, who is recognized as the leading authority on career planning and development, "I am quite impressed with both the technical problems and the practical importance of the administration of tests that have shown occupational significance, such as the GATB, to youngsters when they are about the 9th grade level. This is the choice point. This is where curricula are chosen. The decision may be changed later, but at least a preliminary decision as to type of curriculum is made and these curricular choices are, after all, pre-occupational, whether they are choices of the academic curriculum which is pre-

professional, or the commercial curriculum which is pre-business, or the technical curriculum which is pre-trade. Obviously, it is to the advantage of the student and of the school to have data that help the youngster to choose a curriculum which is oriented toward the type of work and the way of life that he is going to enter or that he may enter eventually."

The GATB is now available for purchase and use in junior and senior high schools. Norms have been established for 9th grade students. Given on a 9th grade level these tests can be used for a variety of guidance functions. Not only will they help to broaden the occupational thinking of a student, but they can also be used as predictors of general school success. The scores derived from the intelligence, verbal aptitude, numerical aptitude and clerical perception parts of the battery are highly related to high school success. There is also considerable evidence that the GABT has a substantial relationship to college success. There is probably no other aptitude test that has been researched as widely and extensively as the GATB.

The following is a summarization of the use of the GATB on a 9th grade level:

1. The scores made on each of the GATB aptitudes can be interpreted to a group guidance class and then individually in a counseling interview. This will assist the student to grow in self-understanding if he is encouraged to evaluate the scores in relation to other information he knows about himself and his past achievements.

2. Counselors can assist students to identify particular aptitude scores which are high. Some students may possess special skills which cannot be easily discovered by regular academic-type tests. The vocational implications of these special skills should then be discussed with the student.

3. The Occupational Aptitude patterns (36) can provide a basis for helping students to learn the test-measured aptitudes which have been objectively and subjectively identified with occupational fields of work. The student may wish to discuss the aptitudes considered important for certain occupations of interest to him, or he may reverse the process and explore the occupational fields related to his aptitude scores.

4. The GATB may be used as a means to motivate vocational planning or study on the part of individual students or of group guidance classes. The test will provide a means to initiate exploration of occupations. The occupations listed in the GATB materials are coded according to the Dictionary of Occupational Titles.

5. The G, V, and N scores on the test can be used as measures of scholastic aptitudes. These measures compare favorably with other tests of school learning ability.

6. The GATB offers help in identifying student skills, in addition to academic skills, which are related to learning potential in a vocational-technical school program.

In conjunction with a group guidance program, an interest inventory could also be used as a motivational device to assist in the study of occupations. Since occupational interest is a developmental process, the results of inventories should not be used as the sole criteria for vocational counseling. However, the results of interest inventories can serve to stimulate additional interest in occupations.

The results of the Kuder Vocational Interest Inventory can be used to explain the need for interest as well as aptitude in arriving at decisions of vocational choice. Educational planning as well as vocational planning must consider an individual's interests and values as well as his aptitudes and achievements.

Since tests help to describe a person as he now is and can be used in conjunction with other factors to help predict what he may do, then the use of any other test results will also prove helpful. Intelligence tests, achievement tests, and personality tests will serve to fill in many additional details concerning an individual's educational and vocational potentiality.

According to vocational educators many of the students who are unable to successfully complete vocational-technical courses are unable to do so because of severe reading deficiencies. Since the vocational-technical school will only accept students who have completed the 9th grade, it is hoped that these students will have enough reading ability to handle vocationally-related reading material. It would seem that a student who has been able to complete 9 years of academic training cannot be sufficiently retarded in reading to be incapable of vocational training. Most students who drop out of school because of a reading deficiency tend to do so prior to 10th grade. Therefore a special reading test at the 9th grade level does not appear to be critical for counseling

toward vocational education.

It would seem advisable to consider any test results that may be available, with emphasis placed upon the results of tests which have been given within the past three years.

Students have been selected for the 1966-67 school term on the basis of the recommendations of the home school guidance counselors. It was felt that not enough time was available this first year to incorporate a complete testing program. The only exception was in Data Processing. All students electing this course, were tested with the IBM Aptitude Test. According to the manual of this test, any student scoring below 35 would be in jeopardy of not being able to successfully complete the course. Since this test was normed on post high school students with a mean age of 30.2 and a mean educational level of 14.3 years, it was decided to drop the cut off point to 30. Students scoring below 30 were recounseled. Counselors were asked to consider other factors such as educational achievement, personality, etc., and then make another recommendation in line with the student's reevaluation of his decision. Some students scoring below 30 will be accepted, but only upon the recommendation of the school counselor. When enough test results are available, local norms will be developed for Data Processing.

Due to a lack of uniformity in test results, for the 1966-67 school term, all students accepted will be tested during the first year. A comprehensive testing program will be

developed within the vocational-technical school to begin the development of local norms. It is hoped that a similar testing program will be developed in the participating high schools, since the test results will be invaluable guidance tools in counseling students. If a uniform testing program could be developed for Carbon County, it would facilitate the development of these local norms.

CUMULATIVE RECORDS

An extensive cumulative record system will be developed for all students in the vocational-technical school. Effective counseling whether educational, vocational, or personal, can only be done with the aid of complete and accurate records. The Student Service Coordinator in the vocational-technical school will be a guidance counselor, and his function will be similar to that of counselors in the participating schools. Thus, the cumulative record folder will serve the same purpose in the vocational school as it does in the home high schools. Extensive information on each student's training within the vocational-technical school will also be an important part of the permanent record. This information will be used in counseling students. It will also be used, to a limited extent, when students are placed in industry. The development of a complete and accurate record on each student is vital to the effective functioning of guidance services.

COUNSELING

With the inclusion of a guidance counselor within the vocational-technical school, guidance services are now being extended and specialized. All guidance services normally found in academic high schools will now be available in the vocational-technical school. These services will include educational counseling, many vocational students will continue their training in a junior or community college; personal counseling, many personal problems may be inherent in the vocational education program; and vocational counseling which will become highly specialized as it pertains directly to the occupational training offered in the vocational-technical school.

Vocational counseling is, and will continue to be, part of the guidance function in all schools. However, the Student Service Coordinator will specialize in vocational counseling in much the same manner as some counselors specialize in college placement. He will become an expert on the specific courses offered at the vocational-technical school. These 15 areas, plus all jobs which may be related to these areas will be a primary concern of the Guidance Coordinator.

The constant accumulation and updating of material which pertains to vocational-technical education will be continuously disseminated to counselors and students through the vocational-technical school counselor.

JOB PLACEMENT

The primary purpose of vocational-technical school training is employment. Every effort will be made to place students in business or industry. Job placement will be a cooperative operation among the vocational instructors, the State Employment Service, and the Student Service Coordinator. When placement is handled by the vocational-technical school, it enables the instructors and the counselor to keep abreast of the latest technological advances. Constant contact with industry helps to develop a well-rounded curriculum. It develops industrial contacts for future student placement, and also helps in the follow-up of students.

Information obtained in student placement can also be used as part of the orientation program. For instance, statistics on the number of students placed, beginning salaries, advancement of past students, etc., is the type of information that students and parents can understand. This information is made up of concrete facts, and not abstract platitudes.

Job placement is one indication of vocational-technical school success. However, this should not be considered the sole criterion. How many students select the academic course and then don't go to college? How many students select the business curriculum, but do not accept jobs in this field? These facts are not used to discredit these courses of study, why should similar statistics be used as a yardstick to measure vocational school success? Naturally, as counselors, we would like to

feel that we have been so successful in counseling students that all students will directly benefit from the training they have elected. This is unrealistic. Some students will benefit from their training indirectly, by going into related fields of work. Perhaps this training will serve to motivate some students to drop vocational schooling and enter a completely different field of study. These cases should be considered successes not failures.

Many factors enter into final job placement. We cannot isolate one or two facts and expect to develop realistic criterion of success.

FINAL INTERVIEWS

A constant effort will be made to develop objective criteria for the evaluation of students. Various tests, counseling sessions and follow-up studies will be done in an effort to gather data which can be used to determine which students would benefit most from vocational-technical school training. Longitudinal studies, such as "Project Talent", and GATB follow-ups, are proving helpful in predicting student success in various job training programs. This information, in conjunction with the development of local test norms, will supplement orientation programs and aid in the counseling of students.

There are many reasons why students decide to terminate their education. If a student decides to drop out, every effort should be made to determine why. A final interview

sheet has been developed to help answer this question. This questionnaire is actually an evaluation sheet. It requires the student to reevaluate his reasons for leaving the program and it affords him an opportunity to critize his training course. This evaluation report will be completed by the counselor through a final interview with the student. Every effort will then be made to utilize this information in a constructive manner.

Information obtained in these interviews can be used to evaluate the orientation program, to augment counseling procedures, and to adjust curriculums. It should be remembered that students leaving the program are not always indications that the program is a failure, on the contrary the course may have served to guide a student into a more satisfying line of endeavor.

FOLLOW-UP

In evaluating a program, follow-up studies are essential. The information obtained would be invaluable for the orientation program, for augmenting counseling techniques, and also for curriculum adjustments.

The difficulty with most follow-up studies is the lack of cooperation on the part of the people being surveyed. However, this information need not be obtained by questionnaires alone. Much follow-up information can be obtained by the vocational instructors in their job placement service.

The questionnaire, however, will probably be the main source of obtaining the necessary information. Knowing that returns tend to be low, certain steps can be taken while students are still in school. The importance of this information can be stressed by instructors during the course of study. If the esprit de corps of the vocational school is developed and maintained, this will also help. The more pride a person has in his school, the more likely he will return requested information.

The form used can be developed into a type of birthday greeting card and mailed at the appropriate time. The accumulation of this information will then become an annual event. This could serve a dual purpose. Constant communication with students will invariably lead to more contacts for possible placement.

This utilization of the alumni could be developed further in much the same way it is done in colleges. A short bulletin or information about the school could be enclosed with the questionnaire. Retraining programs could be listed, and students encouraged to upgrade their skills. Counseling would be available, and might prove to be far more valuable at this level than it was at the high school level.

Naturally students would be offered the opportunity to make suggestions concerning the curriculum. This information, tempered by actual job experience, would supplement suggestions obtained from the craft committees.

The constant evaluation of the vocational-technical school by students, teachers, and industry will help prevent the lock step type of education which still hampers much of education today.

APPENDIX

The following radio scripts were prepared and presented on local radio stations. The first script was developed for an interview program. This program, approximately 15 minutes long, was taped and played on several occasions. Feeling that this was not adequate coverage, ten, one-minute scripts were prepared and played from time to time throughout the broadcasting day for a period of one week. This type of information distribution proved to be the more effective method.

RADIO SCRIPT

Question: Would you tell us something about your work as a Guidance Research Director?

Answer: Yes, I would be glad to. Carbon County has been given a $15,000 Federal Research Grant to study guidance programs in Area Vocational-Technical Schools. As Director of this program, I have been visiting vocational schools in Pennsylvania, New York, New Jersey, and Delaware to collect guidance information. We are now using this information to develop a comprehensive guidance program for students in Carbon County who wish to take Vocational-Technical School Training. When I say we, I mean our Guidance Advisory Committee which is composed of guidance counselors from each of the schools in the County and also two guidance specialists from the Department of Public Instruction in Harrisburg.

Question: What is Vocational-Technical Education?

Answer: Vocational-Technical School education is training for specific occupations such as welding, auto mechanics, practical nursing and so on. It is primarily for non-college bound students. However, a certain percentage of students taking technical level subjects,

such as chemical technology, drafting technology, data processing, and electronics do go on to two and four year colleges. This depends, naturally, on whether they can take the necessary academic subjects in their home high school. However, 80 to 90% of vocational-technical school students go directly to work upon graduation from high school. The training they receive gives them a salable skill. A skill which industry is willing to buy. The jobs these students receive can be classified as skilled or semi-skilled and are in demand throughout the country.

Question: What is an Area Vocational-Technical School?

Answer: An Area Vocational-Technical School is a cooperative venture. If any one high school in Carbon County would attempt to offer 15 additional educational offerings, the cost would be prohibitive. However, when the cost is shared by five schools, as it is in Carbon County, then the program becomes feasible. Thus, the area vocational-technical school is an extension of each of the high schools in our County. For example, Jim Thorpe, can now offer its students 18 courses of study instead of just three.

Question: When will the area vocational-technical school open and who will be eligible to attend?

Answer: The area vocational-technical school will open in September, 1966. Any student in grades 10, 11 and 12 in any area high school is eligible to apply for admission.

Question: How many students will be accepted?

Answer: The school will be able to accommodate over 600 students. This is approximately 25% of all students in Carbon County in grades 10, 11, and 12.

Question: What courses will be offered in the area vocational-technical school?

Answer: At the present time, we can offer a student a choice of 15 different courses. These courses can be divided into three different occupational levels: Vocational, Service, and Technical. The vocational courses are Auto Body Repair, Auto Mechanics, Carpentry, and Cabinet Making, Commercial Art, Electrical Construction, Machine Shop, and Welding. The service

occupations include Cosmetology, Distributive Education, Food Preparation, and Practical Nursing. Technical level occupations are Chemical Technology, Data Processing, Drafting Technology, and Electronics.

Question: Vocational, Service, and Technical Education. How do they differ?

Answer: Vocational level jobs have two basic requirements: knowledge or "know how" and ability to do the job. These two requirements are equally divided - know how is 50% of the course and actually doing the work is the other 50%. The same applies for service courses, however, a third factor must also be considered and that is the ability to meet and get along well with people. Since all these service occupations require meeting the public, the personality factor is important. Technical level courses are difficult, complex subjects and require much more abstract thinking and learning from books. A higher reading level, plus advanced mathematics are necessary. In technical level courses the "know how" requires 75% of available time and the actual doing only 25%.

Question: Since the area vocational-technical school is a separate school, will they have their own athletic teams?

Answer: No. Actually the area vocational-technical school is not a separate school -- it is an extension or additional department of each of the area high schools. In the past, students had a choice of an Academic Course, a Business Course or a General Course. Now students have 15 additional courses to choose from. The area vocational-technical school merely broadens the educational offerings available to students.

Critics of education often claim that educational offerings are too narrow. They claim we are only interested in students who have the ability to go to college.

Well, the people in Carbon County can be proud of the fact that they are now making it possible for non-college bound students to develop skills which will enable them to get a good job, and they will also have acquired the necessary background to advance more rapidly in their chosen occupation.

Question: How much time will a student spend in the area vocational-technical school?

Answer: Most of the courses are three-year courses. This means that students will begin in 10th grade and finish at the end of 12th grade. He or she will spend half of their total school time in their home high school and the other half in the area vocational school. If this is done on a half-day basis, then a student would spend, let's say, the morning school session in their home high school and then they would be bussed to the area vocational-technical school for the afternoon session.

Question: What about eating? Will the area vocational-technical school have a cafeteria?

Answer: Yes. Students may eat in the vocational-technical school cafeteria or bring their own lunch. If you remember, one of the service courses is Food Preparation. Students in this course will help prepare and serve food not only to students but to the faculty as well. In all the schools I have visited this works out very well, and I might add, the service and the food are excellent.

Question: What factors will be considered in the selection of students to attend the Area Vocational-Technical School?

Answer: Students will be selected according to their ability to profit from this type of education. If they do not have the ability to complete a specific course, than trying to place them in a job after graduation would be difficult. We would like to feel that all students who satisfactorily complete these courses will be placed in jobs for which they have been trained.

The Guidance Advisory Committee feels that the following factors will help determine which students will benefit from Vocational-Technical Education.

(1) A student's academic record: the more difficult the course the higher the level of academic achievement.

(2) A student's physical condition. Certain physical handicaps could prevent a student from taking certain courses.

(3) A student's discipline record is extremely important. Students who constantly get into trouble in their home high schools would present a problem because of the strict safety regulations in most vocational courses. A student's attitude will be a distinct factor in selection.

(4) Another factor which must be considered is a student's attendance and tardy record. Because certain courses will require state certification upon the completion of a specified number of hours, good attendance is mandatory.

(5) Test scores will be another factor. Intelligence tests, achievement tests, reading ability, aptitude tests, and interest inventories will all furnish valuable information.

(6) A final factor in student selection and by far one of the most important will be the recommendations from various teachers. All students must be recommended by their guidance counselors. Other recommendations that will be extremely helpful will be industrial arts teachers, home economics teachers, art teachers, math teachers, and homeroom teachers. These teachers know the students much better than we do and they are in a position to render a great service in helping to determine which students would benefit most from vocational-technical school education.

Question: What is being done to inform students about the Area Vocational-Technical School?

Answer: Getting accurate information to students, parents, and teachers is a big job. We have been presenting this information to students and teachers by means of assembly programs. We have a film which explains vocational-technical school education and this has been, or will be shown to all students who will be eligible to attend the vocational-technical school next year. We have also been invited to speak at various community meetings and P.T.A.'s in order to answer the questions of parents and interested adults.

Here again, when I speak of we, I mean Mr. James Tule who is the director of the area vocational-technical school and myself.

We have prepared a Guidance Booklet which outlines all of the information pertaining to the school. The first half of the Guidance Booklet contains policies and procedures for the operation of the Area Vocational-Technical School. These policies have been established by the Professional Advisory Committee which is composed of all Chief School Administrators and members of the local school boards. The latter part of the booklet contains information on the 15 course offerings. These booklets are available to any interested student and adult and can be obtained by contacting the guidance counselors in their high schools.

We would like to thank the newspapers and radio stations for their part in helping to disseminate this information.

RADIO SCRIPT

This is Thomas Foley, Carbon County Guidance Research Director. Are you familiar with the new educational opportunities available through the Carbon County Area Vocational-Technical School? Fifteen new educational courses will be offered to students in grades 10, 11, and 12. These courses will prepare boys and girls to enter the labor market as skilled or semi-skilled workers. According to a thirteen-state survey, done in 1963, 94% of all vocationally-trained students looking for work were placed in jobs. Students who select vocational-technical schooling will spend 1/2 of the day in their own high school and the other half of the day in the area vocational-technical school. Students will graduate from their home high school. They will also participate in all extra-curricular activities in their own high school. The Area Vocational-Technical School is part of the public school system. Students will not have to pay for this training.

RADIO SCRIPT

This is Thomas Foley, Carbon County Guidance Research Director. Critics of education often claim that educational offerings are too narrow. They claim we are only interested in students who have the ability to go to college. Well, the people of Carbon County can be proud of the fact that they are now making it possible through the Carbon County Area Vocational-Technical School for non-college bound students to develop skills which will enable them to get good jobs and to advance more rapidly in their chosen occupations. Beginning in September students in grades 10, 11, and 12 will have the opportunity to select such courses as Auto Mechanics, Auto Body Work, Carpentry and Cabinet Making, Commercial Art, Electrical Construction, Machine Shop, and Welding. Additional courses will offer Cosmetology, Distributive Education, Food Preparation, and Practical Nursing. Technical courses will include Data Processing, Drafting Technology, and Electronics. In order to make intelligent decisions, students as well as parents should know what opportunities are available.

RADIO SCRIPT

This is Thomas Foley, Carbon County Guidance Research Director. What factors will be considered in helping to guide students who are interested in Vocational-Technical School training? Naturally a student should possess the ability to

profit from the type of training he has chosen. If he does not have the ability to complete a chosen course, he would be wasting time which could be better utilized in some other area. We would like to feel that all students who satisfactorily complete these courses will be placed in jobs. Another factor that will be considered is a student's discipline and tardy record. A student with a poor attitude would only be a safety hazard in this type of schooling. A final factor in student selection and by far one of the most important will be the recommendations of teachers and guidance counselors. The Carbon County Area Vocational-Technical School is working very closely with all of the high schools in order to provide students with the necessary information for making intelligent and realistic decisions. Parents can help in this decision making, but only if they are well-informed and know what opportunities are available.

RADIO SCRIPT

This is Thomas Foley, Guidance Research Director for Carbon County. Drafting Technology is a program that offers training for the draftsman at a technical level. A level between the skilled draftsman and the engineer. A course in Drafting Technology will be offered in the Carbon County Area Vocational-Technical School beginning in September. This three-year course will train students to transform sketches, specifications, and notes furnished by engineers and architects

into detailed drawings for skilled draftsmen. Students in this course must have a good background in math. Another course which will be offered on a three-year basis is Carpentry and Cabinet Making. Students in this course will learn form work, roofing, frame work, mill work, and the skills necessary in cabinet making. Carpentry is one of the largest single construction trades, and will offer excellent employment opportunities for skilled craftsmen.

RADIO SCRIPT

This is Thomas Foley, Carbon County Guidance Research Director. Within the last few years, there has been a tremendous increase in the use of computers. In order to train students to use the various equipment in this field of work, a course in Data Processing has been developed by the Carbon County Area Vocational-Technical School. This one-year course, offered to 12th grade students, will train them to use keypunch machines and to learn the basic fundamentals for the operation of computers. These students should possess logical, analytical type minds. Another course which will be offered in September and which is very popular with boys is Auto Mechanics. This course will cover everything from engine diagnosis, tuneup, and repair, to chassis repair and lubrication. This shop will be supplied with all the latest equipment. A boy who successfully completes this three-year course should be a skilled mechanic.

RADIO SCRIPT

This is Thomas Foley, Carbon County Guidance Research Director. The Carbon County Area Vocational-Technical School will accommodate 672 students in 15 different courses of study. A course which has proven to be very popular with the girls is Cosmetology. This is a three-year course beginning in 10th grade. Students completing this course are prepared to take the state examination for a practicing license. Another course which will be offered in September is Electrical Construction. This course will train students to install electrical wiring, switches, lighting fixtures, and other electrical equipment. This is also a three-year course beginning in 10th grade. The demand for Electricians will continue to grow. According to the Department of Labor, the tremendous increase in construction and the increasing installation of automatic machinery will necessitate an increase in the demand for skilled Electricians.

RADIO SCRIPT

This is Thomas Foley, Carbon County Guidance Research Director. Did you know that in Pennsylvania one out of every five employed persons is working in the wholesale or retail distribution of goods? Selling is big business. In order to train students for this type of work, the Carbon County Area Vocational-Technical School will offer a one-year course in Distributive Education. This program is a cooperative

enterprise and will use both the facilities of the school and the marketing and merchandising resources of the community. Students will receive supervised "on the job" training. Another course which will be available in September is a three-year course in Electronics. This is a technical level subject and will require students to understand the basic principles of radar, zonar, micro wave, and television. Students who successfully complete this training will be able to secure employment as electronic technologists. These jobs are para-professional level jobs and are classified between the skilled craftsmen and the professional.

RADIO SCRIPT

This is Thomas Foley, Carbon County Guidance Research Director. The demand for people trained in Food Preparation is growing by leaps and bounds. Competent chefs, restaurant managers, and food service specialists are in short supply. The Carbon County Area Vocational-Technical School will offer a three-year course in Commercial Food Preparation beginning in 10th grade. Students in this course will learn cooking, baking, food purchasing and many other related jobs. Students will prepare and serve all the meals in the student and faculty dining rooms as part of their practical experience. Welding is another course which will be available to students entering 10th grade. Welding is found in a wide range of industries including machinery, cars, planes, ships, boilers, tanks, and

all forms of fabricated structures. Students will learn to weld aluminum and stainless steel using heliarc equipment. They will also learn gas cutting and arc welding. Employment opportunities for welders are very good.

RADIO SCRIPT

This is Thomas Foley, Guidance Research Director for Carbon County. Many students in school today are interested in careers in the field of art. Beginning in September, the Carbon County Area Vocational-Technical School will offer a three-year course in Commercial Art. Students in this course will be trained in lettering, water color, poster techniques, silk screen processes, sign painting and other Commercial Art practices. In order to successfully complete this course, students should possess artistic ability. Another course which appears to be popular with the boys is Auto Body Repair. In the United States today there are over 72 million automobiles. These cars are constantly being damaged, and competent men are needed to repair them. The Auto Body Repair course will be a three-year course beginning in 10th grade. Students will study frame straightening, refinishing, upholstering, glass replacement, and spray painting. Skilled craftsmen in this area are in short supply, and many good jobs are available.

RADIO SCRIPT

This is Thomas Foley, Guidance Research Director for Carbon County. According to the Department of Labor, skilled machinists will have no difficulty finding a job. The Carbon County Area Vocational-Technical School will offer a three-year course in Machine Shop Practice. This course, beginning in 10th grade, will train students to become proficient in the use of all the different machines normally found in industry today. Students contemplating a career as a machinist should have a good background in math and have the patience to work with pains-taking accuracy. Another course which will be offered in September is Practical Nursing. This course is available to students in 12th grade. They will spend their senior year learning the basic fundamentals of nursing, then upon graduation from high school they will work from 12 to 14 weeks in a hospital. At the completion of this on-the-job training students will be eligible to take the State Licensing Examination for certification. A licensed Practical Nurse should have no difficulty finding employment.

RADIO SCRIPT

This is Thomas Foley, Carbon County Guidance Research Director. With the opening of the Carbon County Area Vocational-Technical school in September, students from our area will have 15 new courses of study to choose from. A few of these subjects

are auto body repair, chemical technology, electronics, drafting, and welding. Students, who in the past, were limited to Academic, Commercial, or General Education will now have to plan their future with 15 additional topics in mind. This decision is an extremely vital one in the life of any student. Parents can help, but only if they are well-informed. Too often poor decisions are based on faulty information.

To receive accurate information on this topic, I urge you to attend the Jim Thorpe Area PTA meeting, Monday, March 14. Mr. Newton Davenport, Carbon County Superintendent of Schools; Mr. James Tule, Director of the Vocational School; and I, will form a panel to discuss this all-important question.

Won't you plan to be there, too?

The following T.V. scripts were prepared for five to ten minute interview-type programs. On most occasions, the script was used merely as an outline.

T.V. SCRIPT

Question: Last week we saw pictures of the vocational school building. Tonight Mr. Foley is going to discuss the various courses which will be offered there. Just how many different courses will be available?

Answer: Students will have a choice of 15 different courses of study. In order to better explain how these courses differ, we have broken them down into three groups. One group will include all vocational level courses such as:

1.	Auto Body Repair	3 yrs.	Boys
2.	Auto Mechanics	3 yrs.	Boys
3.	Carpentry & Cabinet Making	3 yrs.	Boys
4.	Commercial Art	3 yrs.	Boys & Girls
5.	Electrical Construction	3 yrs.	Boys
6.	Machine Shop	3 yrs.	Boys
7.	Welding	3 yrs.	Boys

These vocational level courses prepare a student for work at the skilled craftsmen level. 50% of the student's time will be spent in learning the "WHY" of the job and the other 50% will be spent learning the "HOW". Another way of putting it would be that half of the time is theoretical or book learning and half of the time is actually working with your hands.

Another group will include all service level courses. These courses prepare a student to perform acts of service for other people. These courses require three aptitude levels:

1. The know "WHY"
2. The know "HOW"
3. And the ability to meet and get along with people.

These courses will include:

1.	Cosmetology	3 yrs.	Girls & Boys
2.	Distributive Education	1 yr.	Girls & Boys
3.	Food Preparation	3 yrs.	Girls & Boys
4.	Practical Nursing	1 yr.	Girls

The third group of courses are the technical level courses. These courses differ from the others in that technical level subjects require 3/4 of the student's time learning the theory or the "WHY" of the work. Only 1/3 of the time is spent learning manipulative skills or working with your hands. These courses include:

1.	Chemical Technology	2 yrs.	Girls & Boys
2.	Data Processing	1 yr.	Girls & Boys
3.	Drafting Technology	3 yrs.	Girls & Boys
4.	Electronic Technology	3 yrs.	Girls & Boys

These courses prepare a student to work at a level between the skilled craftsman and the engineer or professional. They are difficult courses and will require much studying.

Question: Who will be eligible to apply for these courses?

Answer: Any student in the county in grades 10, 11 or 12. Information and application forms are available from the Guidance Counselors in all high schools. Parents and interested adults may also obtain information by contacting the guidance counselor in their local school. A guidance bulletin has also been prepared and is available to any interested person. This booklet lists all courses and the necessary qualifications for acceptance.

Question: Are the qualifications for acceptance the same for all courses?

Answer: No - qualifications differ according to the course. For instance, technical level courses will require a more extensive background in math. Service occupations will require a person with a pleasant personality and so on. Students will be helped by their guidance counselors to select those courses which would be most beneficial for them.

Question: When students graduate will they be helped to secure employment?

Answer: Yes - Since students will be selected on the basis of their ability to successfully complete the course, we will then do everything possible to see that students are placed in jobs for which they have been trained. Incidentally, this will be part of the guidance program in the Vocational School.

Question: What will you discuss next week?

Answer: Next week I would like to begin discussing more in detail each of the 15 course offerings. I have pictures of each of the courses as they are now being taught in nearby Area Vocational-Technical Schools. I would like to show these pictures and also discuss each of the courses.

T.V. SCRIPT

Question: Last week Mr. Foley outlined the various courses which will be offered at the Vocational-Technical School. Tonight he plans to go into more detail about some of these courses. Just what courses will you discuss this evening?

Answer: I would like to show some slides and talk about four courses which will be offered this September. The first course is Electronics.

Electronics is a technical level subject. This means that students will be trained to qualify for pre-professional or para-professional level jobs. (Jobs between the skilled craftsmen and the professional.) Electronic technologists work with micro waves, zonar, radar, television, the electric eye, and other forms of advanced communications. To qualify for this training students must have a good background in math and be willing to work hard and study difficult material.

This first picture was taken in the Electronics laboratory in the Easton Vocational School. You can see some of the complex equipment being used in this class.

The next slide, taken in the Bucks County Vocational School shows how the classroom is utilized in conjunction with the lab.

Two-thirds of a student's time will be spent learning the principles underlying the use of various testing devices.

Question: Electronics is a technical course. Do you have anything for a student interested in art?

Answer: Yes we do. We will offer a course in Commercial Art. This program will be three years long beginning in the 10th grade.

Since success in the field of art is dependent upon talent, students interested in this type of work should possess artistic ability.

The course will include such things as lettering, water color and poster techniques, silk screen processes, sign painting, and other Commercial Art practices.

This picture is a Commercial Art class in the Bucks County Vocational School.

Question: We have seen a technical and a vocational level course. What about a service occupation?

Answer: We actually have four courses in service occupations. Cosmetology, Distributive Education, Practical Nursing, and Food Preparation. The one I have chosen for tonight is Food Preparation.

The demand for people trained in Food Preparation is growing by leaps and bounds. Competent chefs, restaurant managers, and food service specialists are in short supply. This course will train students in all of these areas.

A student will learn cooking, baking, food purchasing and many other related jobs.

The Vocational-Technical School will have its own cafeteria. The preparation and serving of this food will be done by students in the Food Preparation course.

This second picture is the faculty dining room at the same school. The preparation and serving of all food in this dining room is done by students.

Question: Well, that's three courses. What is another program that will be available in September?

Answer: Another vocational level course is Welding.

Welding is a three-year course and students will learn such things as the welding of aluminum and stainless steel using heliarc equipment. He will also learn gas cutting of metals and gas and arc welding.

Employment opportunities for welders are very good. Welding is found in a wide range of industries. Machinery, cars, planes, ships, boilers, tanks, fabricated structures all require some form of welding.

Both of these pictures were taken in the Upper Bucks Vocational School. Notice the individual booths. Student safety is an essential part of all programs. Students will be well protected against injury.

Well, that's it for this evening. Next week I will discuss four more courses in the Carbon County Area Vocational-Technical School.

T.V. SCRIPT

Introduction: Last Thursday we discussed four of the courses which will be offered in the Carbon County Area Vocational-Technical School: Electronics, Commercial Art, Food Preparation and Welding. What courses will you cover this evening?

Answer: I would like to show some slides and discuss four more courses. One of the most popular courses which will be offered in September is Auto Mechanics. Since this course will have more applicants than available positions, only those students who seriously plan to follow this line of work will be accepted.

This course will cover everything from engine tune-up, diagnosis, and repair to chassis repair and lubrication. As this picture shows, students will work on actual cars. All necessary equipment to service cars will be available.

On this next slide, which was taken in the Easton Vocational School, you can see a teaching model of a car. In the background is a visual car alignment pit.

Question: Won't the cost of equipment make this form of education expensive?

Answer: Yes, that is true. That's why most school districts by themselves could not offer this type of education. However, when five districts share expenses and the Federal and State Government chip in, it becomes possible.

Another course which necessitates a great deal of equipment is the Machine Shop.

You can see on this slide all the various pieces of equipment which are necessary to turn out a well-trained machinist.

Here's another picture of a machine shop. Notice how well-lighted these rooms are.

Students who want machine shop should have a good background in math, and have the patience to work with painstaking accuracy.

Question: The courses we have discussed so far are for boys. What are some courses girls can take?

Answer: Last week we discussed two such courses - Commercial Art and Food Preparation. Another course is Practical Nursing.

This course is only offered to seniors. All their theory work will be taken at the Vocational School. Then when they graduate they will work in a hospital for a 12 to 14 week period. At the end of this time they are eligible to take the State Licensing Exam for certification.

Here is a picture showing some of the facilities in a course of this nature.

This picture shows some additional facilities.

Question: There is always a demand for people in the field of selling. Do you have a course in this area?

Answer: Yes, we do. Distributive Education is a course which will cover all phases of selling. In Pennsylvania, one out of every five employed persons is already working in fields covered by Distributive Education.

These students will learn business operations, advertising, buying and so on.

This slide shows students operating their own store which is located within the school.

This next picture shows a girl working in a display case.

That's it for this week.

T.V. SCRIPT

Introduction: Last Tuesday Mr. Foley discussed four of the courses which will be offered in the Carbon County Area Vocational-Technical School. Tonight he plans to discuss three more courses. Where do we start?

Answer: I would like to start with a course which is very popular with the girls -- Cosmetology. This will be a three-year course beginning in 10th grade. Students completing the course will be prepared to take the State Examination for a practicing license.

This slide shows typical facilities for this type of training.

On this next slide you can see that practical experience in hairdressing is obtained by styling the hair of girls in the class and also women from the community.

Since the demand for this course will probably exceed the available positions, certain qualifications will be important. For instance, the ability to

meet and get along well with people, and personal cleanliness and neatness.

Question: Cosmetology is generally thought of as a woman's occupation. Are there not many men who have been highly successful in this type of work?

Answer: Yes, in fact many men who enter this field are extremely successful. This course will be available for girls or boys.

Question: How about Electrical Construction? Is this for boys only?

Answer: Yes. Electrical Construction will train boys to install electrical wiring, switches, lighting fixtures, and other electrical equipment.

In this slide you can see boys working on various pieces of electrical equipment. In the background is a structure which is similar to a house. This affords practical experience.

This next slide shows additional facilities in Electrical Construction.

Question: Electricians are always in demand. How about the future for this type of employment?

Answer: Well, according to the Department of Labor, with the tremendous construction demands and the installation of automatic machinery, electricians will have plenty of work.

Question: Speaking of automation, do you have any courses which will train students to work computers?

Answer: Yes, we do. Data Processing will teach keypunch operation and also the basic fundamentals for computer operation.

Here is a picture of the type of equipment necessary to train students in Data Processing.

This picture shows a student actually working with a computer.

This last picture is a close-up of a computer being used in the Upper Bucks Technical School.

Question: How will a student qualify for Data Processing?

Answer: Interested students will be given an IBM Aptitude test. The results of the aptitude test plus the recommendation of the guidance counselor will form the basis for qualification.

Question: Sounds interesting. What about next week?

Answer: Next week I should be able to complete the rest of the available courses.

T.V. SCRIPT

Introduction: Last Tuesday Mr. Foley discussed three courses which will be offered in the Carbon County Area Vocational-Technical School in September. Tonight he plans to conclude these discussions with an explanation of the final three courses. What are these final three courses?

Answer: Auto Body Repair, Carpentry and Cabinet Making, and Drafting Technology.

Let's start with Auto Body Repair. This is a three-year course beginning in 10th grade. These students will be taught frame straightening, body and fender repairs, refinishing, upholstering, glass replacement, and spray painting. Here is a picture of a typical Auto Body Shop.

The Auto Body course is one of the three most popular courses with the boys. The other two are Auto Mechanics and Machine Shop.

Question: There seems to be a demand for Drafting Technologists. Isn't this a popular course with the boys?

Answer: No, for some reason it is not. I don't know why because this is a course which will train students to work at a level between the skilled craftsmen and the professional engineer or architect. These jobs pay very well and there is a constant demand for technologists.

This picture gives you some idea of the type of facilities for this class.

Here is another picture of Drafting facilities.

Question: Don't drafting students have to have a good background in math?

Answer: Yes, they do. In fact, the Area Vocational-Technical School plans to have a full-time academic math teacher to give these students the additional math they will need.

Question: Could a girl take this course?

Answer: Yes, in fact I would like to see more girls become interested in this area.

Question: Carpentry and Cabinet Making, I see is next. Is this a good area for a boy to be trained in?

Answer: Yes, it is. In fact, carpentry is one of the largest single construction trades. Boys in this course will learn form work, roofing, frame work, mill work, and the skills necessary in cabinet making.

Here is a picture of the Carpentry Shop in the Easton Area Vocational-Technical School.

Notice the frame of a house there in the background. This provides practical experience. Next year the vocational school plans to build an actual house.

This last picture is the Carpentry Shop in the Upper Bucks Vocational-Technical School.

That completes all the courses that we will have to date. I would like to thank you and the television station for your cooperation in making it possible to give this information to parents and interested adults.

NEWSPAPER ARTICLES

The following 16 newspaper articles were prepared and distributed to all newspapers serving residents in Carbon County.

GUIDANCE IN VOCATIONAL EDUCATION

Students in Carbon County are presently being counseled by guidance counselors in their high schools concerning the many opportunities available in the soon-to-be-opened Carbon County Area Vocational-Technical School. These guidance services can help students and parents make realistic educational and vocational decisions.

According to Dr. Kenneth Hoyt from the University of Iowa, "We in guidance consider our function to be essentially one of helping people choose wisely from among the alternatives available to them. We do this by encouraging the student to learn, think, consider, and decide about himself and his opportunities. We don't consider it nearly so important what people choose as we do that they choose from the widest possible range of opportunities. We aren't as concerned about what the student decides about his opportunities as we are what he decides about himself in relation to these opportunities. We don't want to make people do things -- we want to let them find ways of doing things. We aren't as interested in the something they become as the someone they become."

We are experiencing the most rapid rate of occupational change in the history of this country. The rise and fall of specific occupations makes it mandatory that we discard the notion that vocational guidance is a one-time event. Students graduating today can expect to change the type of work they do from three to five times during the course of their working life. Thus, vocational guidance should be a continuing service available to people whenever the need arises. Make an appointment with your guidance counselor. Find out what additional opportunities are available in vocational-technical education.

VOCATIONAL-TECHNICAL SCHOOL EDUCATION

What are some of the advantages for Carbon County through Vocational-Technical School Education?

(1) More students will complete high school.

(2) More students will become employable.

(3) More students will qualify for better jobs.

(4) Adults can learn new trades.

(5) Adults can be retrained.

(6) Drop-outs can continue their education.

(7) Special courses can be offered to meet the needs of industry, labor and business.

(8) Business, Labor and industry can be supplied with the technicians they need to meet technological advances.

(9) Business, labor and industry are attracted to areas capable of producing trained manpower.

(10) By having more productive citizens, area buying power will be increased and economic growth stimulated.

(11) Better trained people make better citizens, and help lower welfare costs.

Among the objectives of vocational education are: to prepare students for the world of work, to provide employable skills, and to meet the needs of industry. Industrial job placement is therefore one of the indicators of the success of vocational education.

According to a 1963 survey of 13 states in the North Atlantic region, 94% of all graduating vocational-technical school students seeking employment were placed.

In addition to being able to secure entry jobs, the graduates of this follow-up study should be able to be retrained more readily should the need arise. They should thus feel a higher degree of job security than youth with no skill training who enter the job market directly upon graduation from high school.

In 1963, 13,610 vocational-technical school graduates of the North Atlantic region were employed in jobs related to their training. Their entry pay in these jobs was close to 45 million dollars. Assuming these people are employed for 30 to 40 years, there is no doubt that investment in vocational education pays extremely high dividends.

AUTOMOBILE MECHANICS

When a person pays $3,000 or more for an automobile, he is usually quite concerned about who services and repairs it. Good automobile mechanics are hard to find. Why? One reason is that there are over 72 million automobiles on the road today, and only a little over 700,000 mechanics to service and repair them. Thus, the demand for skilled mechanics is constantly increasing.

In September, 1966, the Carbon County Area Vocational-Technical School will offer a course in Auto Mechanics. This program will provide students with a working knowledge of all phases of automobile repair and maintenance. Units of work will include: engine tuneup, diagnosis and repair; chassis lubrication, maintenance and repair; and general services and maintenance.

Students considering this training should have good mechanical aptitude and a keen interest in pursuing this type of work after graduating from high school. This course usually has more applicants than it is possible to accept. Thus, a student can expect stiff competition for the available positions.

One of the advantages of this type of work is the fact that jobs are available in every section of the country from the largest cities to the smallest towns. Most auto mechanics work in shops employing from one to five mechanics and modern repair shops are usually well-ventilated, lighted and heated.

How much you earn will depend on how good you are. Salaries range from $2.25 an hour in Tennessee to better than $4.00 an hour in California. Trained mechanics setting up their own shops, may do better.

If you are interested in this line of work, you should discuss it very carefully with your guidance counselor and anyone else who may be able to help you.

AUTO BODY REPAIR

With the millions of automobiles on our highways today, we must have specialists to do body and fender repair work on damaged automobiles.

The Carbon County Area Vocational-Technical School will offer a course in Auto Body Repair Work beginning in September, 1966. This shop will have all the modern facilities to train young men for this never-ending trade of repairing and refinishing automobile bodies. Students will learn to weld, solder, shrink metal, form metal, use power jacks, and handle frame tools. Training will also include automobile painting. A student will learn to match thousands of different shades of color so that the damaged part, when repaired, will look new.

Employment opportunities for Auto Body Specialists are very good. Millions of dollars are spent every year on the repair of automobile bodies. According to the 1964 edition of

the Occupational Outlook Handbook which is published by the U.S. Department of Labor, some auto body repairmen in large cities earn more than $10,000 a year. This is the exception rather than the rule; however, average salaries in this field are constantly improving. Most skilled body repairmen are paid a percentage of the labor cost charged to the customer. Each repair job is assigned a fixed labor charge and the highly-skilled bodyman can earn considerably more than the average because he is able to make repairs in less time.

A student contemplating a career as a specialist in Auto Body Repair should have a sincere desire to do this type of work. Mechanical aptitude and interest are also good indications of potential success in this job.

Your guidance counselor can give you any additional information you may need, and he will also help you decide whether you are qualified for this line of work.

CARPENTRY & CABINET MAKING

Carpenters, the largest single group of building trades workers, are employed in almost every type of construction activity. They erect the wood framework in buildings, including sub-flooring, sheathing, partitions, floor joists, studding and rafters. When the building is ready for trimming, they install molding, wood paneling, cabinets, window sash, door frames, doors, and hardware, as well as build stairs and lay floors. They build

forms used to enclose concrete for bridges, buildings and other structures. Carpenters also saw, fit, and assemble plywood, wallboard, and other materials. Because of the wide scope of the work performed in the trade, many carpenters will specialize in a particular type of work such as installing acoustical paneling, or laying hardwood floors, etc.

Most carpenters work in the construction industry and are employed mainly by contractors and homebuilders at the construction site. Carpenters are mostly employed in new construction, however, a large number are employed on alteration or modernization work.

The Carbon County Area Vocational-Technical School will offer a three-year course in Carpentry and Cabinet Making beginning in September, 1966. Students interested in this type of work usually enjoy working out-of-doors. They possess some mechanical aptitude and also physical stamina.

Tens of thousands of job openings will be available each year. Young men who receive well-rounded training, such as that offered at the Vocational-Technical School, will have especially long-range job opportunities.

A 1962 survey of workers in 53 large cities revealed that salaries for carpenters ranged from $2.50 an hour to $5.05 an hour. Salaries depend on type of work and location.

Students contemplating carpentry as a career should discuss this very carefully with their Industrial Arts Teacher, their guidance counselor, and any other adult that may be able to furnish them with pertinent information.

COMMERCIAL ART

Artwork designed to attract the attention of readers and to stimulate their interest in particular products and ideas is found in most newspapers, magazines, and other publications. Illustrations used in advertisements and editorial features are prepared by commercial artists who also work on television commercials and movie cartoons, industrial and other films, fashion illustrations, greeting card and book illustrations and design, packaging, wallpaper and textile designs, and many other kinds of artwork. They may also design and illustrate displays, posters, and direct mail advertising.

An estimated 50,000 commercial artists were employed in early 1963; about one-fourth were women. Most commercial artists are employed in big cities, however, many work as free-lance artists selling their art work to any available customers.

Artistic ability and interest are most important qualifications for success in this field.

The Carbon County Area Vocational-Technical School will offer a three-year course in Commercial Art. The course will include lettering, sign painting, silk screen processes, displays, illustrations, watercolor and poster techniques, and commercial art practices. Upon completion of high school, commercial art students may continue their training in various art schools throughout the country.

Employment and advancement opportunities for talented and well-trained commercial artists in most kinds of work are expected to be good throughout the rest of the 1960's.

After a few years of experience, qualified artists may expect to earn $100 to $150 or more a week. Art directors, designers, executives, well-known free-lance illustrators, and others in top positions generally have much higher earnings, many beyond $15,000 a year.

Before making a final decision, students should talk with their art teacher and check the opportunities in this field very carefully with their guidance counselor.

COSMETOLOGY

Cosmetologists or beauty operators, beauticians, or hairdressers, as they are sometimes called, provide their customers with a variety of services, largely related to the care of the hair. They give permanent waves and cut, style, shampoo, set, straighten, bleach or tint the hair. Beauticians may also give manicures and scalp and facial treatments, provide makeup analysis, shape eyebrows, tint eyebrows and eyelashes, and arrange wigs and chignons. In small shops operators are required to do all types of work, but in large salons they may specialize in different phases of work such as hair styling, hair coloring, etc. Men are more likely to specialize than women. In fact, more than 10% of employed beauty operators are men.

Cosmetologists are employed mainly in private shops and salons, department and specialty stores, and hotels located in all parts of the country. Employment opportunities are more prevelant in urban areas, however, small town operators are finding the customer load to be more than adequate. Competition for customers will increase and thus the more highly skilled beauticians will be the most successful.

A three-year course in Cosmetology will be offered at the Carbon County Area Vocational-Technical School beginning in September of 1966. Because of the popularity of this course, more applications are received than positions are available. Students interested in this type of work should have the ability to meet and work with people. They should also possess personal cleanliness and neatness.

The training offered in the Area Vocational-Technical School will meet all requirements for state licensing. Upon completion of the course students will take the state examination for a practicing license.

Students interested in Cosmetology should discuss the advantages and disadvantages of this work very carefully with their guidance counselor before making a final decision.

DATA PROCESSING

The need for skilled personnel in the field of Data Processing is increasing rapidly. It is estimated that the Data Processing industry will employ three million people

by 1970. Data Processing is presently used in banking, business administration, retailing, transportation, engineering, law, and even medicine.

Industry and business are training their own employees, but they have not, and will not, go into the area of Public Education. This educational void is presently being filled by Private Vocational Schools. We in Carbon County are now in a position to offer Data Processing and Computer Programming to any eligible 12th grade students as part of their high school educational program.

Units of work will include: functional wiring principles, numbering systems, Boolean algebra, fundamental of programming, machine accounting, and keypunch operation.

Plans call for the purchasing of the following equipment:

IBM Printing Keypunch
IBM Interpreting Card Punch
IBM Sorter W/Card Counter
IBM Collator
IBM Accounting Machine
IBM Reproducing Punch
IBM 1130 Computing System
1131 Central Processing Unit 8K
W/Attachments 3616-1132-3854
Adapter and 4454-1442

The instructor should hold a B.S. degree in either engineering, mathematics, physics, or business administration with a math background. Advanced degrees and IBM schooling are desirable. The instructor should have two to five years experience in data processing.

Student qualifications for Data Processing are:

Completion of 11th Grade
Background in Business Education
Above average Math Ability
Successful Completion of IBM Entrance Examination
Recommendation of Business Teacher and Guidance Counselor

Interested students should contact their guidance counselors for additional information.

DISTRIBUTIVE EDUCATION

Did you know that one out of every five employed persons in the State of Pennsylvania is working in a field covered by Distributive Education.

Distributive Education includes all occupations directly engaged in merchandising of retail or wholesale goods and services. Efficient marketing and merchandising activities enable the consumer to obtain readily the goods and services that are available.

A good background in Distributive Education includes economics, advertising, store organization, salesmanship, management, interior and window display, retail mathematics, textiles, business law, and merchandising.

If a student shows initiative and imagination, there is no limit to how far he may advance. Job opportunities are unlimited. Many students trained in Distributive Education

become buyers for stores, store managers, fashion assistants, stock control supervisors, enter advertising occupations, and are engaged in all phases of selling.

Salaries vary and are dependent on type of work and locality. Many sales people average $75 to $150 a week. Buyers and store managers average between $5,000 and $10,000 a year.

Distributive Education will be offered at the Carbon County Area Vocational-Technical School beginning September, 1966. The program is a cooperative enterprise using both the facilities of the school and the marketing and merchandising resources of the County. Supervised "on the job" training will be provided.

Students who are most successful in this field usually have pleasant personalities, and like to meet and work with people.

Since Distributive Education covers so many different job areas, specific questions should be directed to your guidance counselor.

DRAFTING TECHNOLOGY

In making a space capsule or an electric iron, a nuclear submarine or a television set, a bridge or a typewriter, manufacturing and construction companies need detailed plans giving dimensions and specifications for the entire object and each of its parts. The workers who draw these plans are draftsmen.

Drafting technicians translate the ideas, rough sketches, specifications, and calculations of engineers, architects, and designers into working plans for draftsmen who further develop this material into working plans for skilled craftsmen. Drafting technology is a program that offers training for the draftsman at a technical level. The drafting technician will work at a level between the engineer and the skilled draftsman.

The Carbon County Area Vocational-Technical School will offer a three-year course in Drafting Technology. Students who are successful in this type of work usually possess average or better math ability, and do well in courses like mechanical drawing. If you like precision drawing and working with details, check with your guidance counselor for additional material on this subject. Incidentally, 6% of all workers employed in the field of drafting were women.

Once a student has acquired a basic background in drafting he may specialize in a particular field such as mechanical, electrical, electronic, aeronautical, structural, or architectural drafting. Additional schooling on a college level is available for those students wishing to further their specialization.

Opportunities for Drafting Technologists at the present time are unlimited. Due to the nature of the work and the skill level involved, Drafting Technology cannot be automated and the

supply of qualified workers cannot meet the demand.

Salaries of Drafting Technicians range from $5,000 to $10,000 a year, depending on the type of work and location.

ELECTRICAL CONSTRUCTION

The Carbon County Area Vocational-Technical School will offer a three-year course in Electrical Construction work beginning in September, 1966. This course is a broad, basic, well-balanced program in practical electricity. A student is taught to install electrical wiring, switches, lighting fixtures, and other electrical equipment. Practical experience and knowledge in the field of armature and motor repair and rebuilding are also a feature part of this course. This training will enable a student to work as a construction electrician or a maintenance electrician.

Most construction electricians work for electrical contractors. Substantial numbers are self-employed. Others work for government agencies or business establishments.

The number of construction electricians is expected to rise substantially during the remainder of the 1960's and in the longer run, primarily because of the large increase anticipated in construction activity. Other factors which are expected to contribute to the growth of this trade are greater requirements for electric outlets, switches, and wiring in homes to accommodate the increasing use of appliances and air-conditioning systems;

and the extensive wiring systems needed for the installation of electronic data processing equipment and electrical control devices being used increasingly in commerce and industry.

Hourly wage rates of construction electricians are among the highest in the skilled building trades. A 1962 survey indicated that minimum union wages ranged from $3.30 an hour in North Carolina to $5.02 in California. Salary is naturally dependent upon type of work and geographical location.

Students who are contemplating this type of work should have average mathematical ability and an interest in electricity.

Be sure to check with your guidance counselor for additional material, before making a final decision.

ELECTRONICS TECHNICIAN

The Carbon County Area Vocational-Technical School will offer a three-year course in Electronics Technology beginning in September, 1966.

Electronics technology includes radio, radar, sonar, telemetering, television, telephony, and other forms of communication; industrial and medical measuring, recording, indicating, and controlling devices; navigational equipment; missile and spacecraft guidance and control instruments; electronic computers; and many other types of equipment using vacuum tubes and semi-conductor circuits. Because the field is so broad, technicians generally specialize in one area.

Electronics technicians work with engineers and scientists in the field of electronics and need a strong background in theory and mathematics to enable them to handle complex technical work above the level of routine operating and repair jobs. Many students upon completion of this three-year course will continue their schooling in a two-year junior college.

Salaries in this field are based upon type of work and location. Most electronics technicians earn between $4,000 and $10,000 a year. In 1962, 12% of the people employed in this field were women. Advance schooling will naturally increase a person's earning potential.

Employment opportunities for qualified technicians are excellent. This field is growing so rapidly that schools are unable to meet the demand.

Students who are successful in this type of training have average or better ability in mathematics and usually average or better grades in all other subjects. They are willing to work hard and to study difficult material.

If you are considering this field of work, it would be advisable to talk to your math teacher, your guidance counselor and anyone else who could give you additional information.

FOOD PREPARATION

If you like to prepare food, jobs are available in restaurants, hospitals, schools, hotels, stores, private clubs, railroad dining cars, and aboard luxury liners cruising vacation spots all over the world. Thus, a qualified person in this area can choose not only the setting in which he will work, but also the area of the country he likes best.

How much you earn will depend on how good you are. Chefs and head cooks may earn up to $15,000 a year. Some chefs with national reputations receive more than $25,000 a year. However, the average salary range is between $5,000 and $10,000 a year depending on the type of work and the locality. Approximately 50% of the chefs and cooks in this country are women.

The demand for qualified people in this field is constantly increasing due to population growth, added leisure time, and higher incomes. Many people engaged in food preparation jobs become managers or assistant managers of eating establishments. Some become specialists in preparing particular types of food and thus increase their earning potential.

The Carbon County Area Vocational-Technical School will offer a course in Food Preparation. This course offers training in all aspects of food preparation and service. The program of instruction will follow a planned procedure through the presentation of theoretical instruction in subjects such

as principles of cookery, baking, accounting, and the purchasing of food. This will be followed by individual practical application through the student cafeteria, and the faculty cafeteria of the Vocational-Technical School. Under the direction of the instructor and with the assistance of professional personnel, it will be the responsibility of the students within this class to plan for and prepare all meals served within the school facilities.

People who are most successful in this line of work usually possess physical stamina, the ability to work under pressure during busy periods, and a keen sense of taste and smell.

For additional information on opportunities in food preparation, check with your guidance counselor.

MACHINE SHOP

The all-round Machinist is a skilled metal worker who makes parts with machine tools. A Machinist can set up and operate most types of machine tools. His wide knowledge of shop practice and the working properties of steel, cast iron, aluminum, brass, and other metals, and his understanding of what the various machine tools do, enable him to turn a block of metal into an intricate part meeting precise specifications. A well-trained machinist selects the tools and material required for each job and plans the cutting and finishing operations in order to complete the finished work according to blueprint or written

specifications. He often uses precision measuring instruments such as micrometers to measure accuracy to thousandths and even millionths of an inch.

A three-year course in Machine Shop practice will be offered to students in Carbon County in September, 1966, at the Area Vocational-Technical School. Students interested in becoming Machinists should be mechanically inclined and temperamentally suited to do highly accurate work that requires concentration as well as physical effort. A good background in mathematics is helpful.

Employment opportunities for skilled Machinists will continue to increase, especially in maintenance shops, as industries continue to use a greater volume of complex machinery and equipment. Some companies require their machinists to take advance courses in mathematics and electronics, at company expense, in order to operate numerically-controlled machine tools which are becoming more prevelant.

Salaries are dependent on type of work and location and range from $2.00 an hour to more than $5.00 an hour.

An important advantage of this occupation is that Machinists can be employed in almost every locality and industry because their skills are required to maintain all types of machinery.

Students wishing additional information on this subject should consult their industrial arts teacher and guidance counselor.

PRACTICAL NURSING

Licensed practical nurses assist in the care and treatment of the physically and mentally ill, under the direction of physicians or professional nurses. As members of a nursing team, they perform many of the less complex tasks, thus freeing professional nurses for more skilled and specialized duties. Practical nurses usually give prescribed treatments and medications, take patients' temperatures, pulse, and blood pressure readings, and help with bathing and other personal hygiene tasks. They may also provide nursing care for newborn babies and their mothers, the handicapped, the chronically ill, or the convalescent. In doctors' offices, practical nurses assist physicians or professional nurses in the examination of patients, give simple medications or treatment as directed, make routine laboratory tests, and perform some clerical tasks.

Beginning in September, 1966, students in Carbon County will be eligible to take a course in Practical Nursing from the Area Vocational-Technical School. The course will be divided into pre-clinical or classroom instruction, and clinical instruction which will consist of on-the-job training in a local hospital. Since a Practical Nurse must be 18 years old to be licensed, students will receive their hospital training after graduating from high school.

Students considering this type of work should have a sincere desire to help sick people. Also important are tact,

patience, understanding, emotional stability, dependability, and good physical health.

Licensed Practical Nurses are expected to have excellent employment opportunities. Many opportunities will arise due to population growth, extended medical coverage programs, the increasing health consciousness of the public, and many other factors affecting the demand for all types of health care.

Average weekly salaries of Practical Nurses in hospitals in 15 metropolitan areas surveyed during 1960 ranged from $42 a week in Georgia to $75.50 a week in California. The Federal Government in 1963 hired Practical Nurses at starting salaries of $3,820 a year.

For additional information on Practical Nursing see your guidance counselor.

WELDING

Did you ever stop to think how much your every day life is influenced by the art of welding? The food you eat has been refrigerated, and refrigeration units require welding. The water you use to wash comes from pipes requiring welding. Transportation; your car, the train, a bus, all require some forms of welding.

A person skilled in the art of welding can work in shipbuilding, structural engineering, automotive, and aircraft industries, guided missiles, nuclear energy, railroads, radio, television, and appliances.

Opportunities are unlimited. Here are some of the jobs available to people skilled in various areas of welding:

(1) Welding Operator
$1.70 to $2.50 an hour
(2) Welder
$2.00 to $4.50 an hour
(3) Welder-Fitter
$2.50 to $4.50 an hour
(4) Specialist Welder
$2.20 to $4.70 an hour
(5) Welding Supervisor
$3.00 to $4.50 an hour
(6) Welding Analyst
$2.50 to $4.50 an hour
(7) Welding Technician
$5,000 to $10,000 yearly
(8) Welding Inspector (Assistant & Senior)
$5,000 to $10,000 yearly
(9) Welding Foreman
$7,000 to $10,000 yearly
(10) Welding Engineer
$6,000 to $14,000 yearly
(11) Welding Development Engineer
$6,000 to $14,000 yearly
(12) Welding Research Engineer
$6,000 to $14,000 yearly
(13) Sales Engineer
$6,000 to $20,000 yearly
(14) Technical Write and/or Editor
$6,000 to $15,000 yearly

Most of these jobs require a high school diploma plus vocational school training. As the skill level advances a college degree is required.

Welding will be offered as one of the courses in the Carbon County Area Vocational-Technical School. It is a three-year course which requires mechanical aptitude and interest, manual dexterity, and good eye sight.

Students wishing to pursue welding beyond the high school level, may work toward a two-year Associate Degree in a Community College such as Williamsport.

In our society, technological advances are rapid. Most jobs are constantly being up-graded. More and more education is necessary to keep pace with industry. Welding jobs are no exception.

For specific information on any of the above listed jobs contact your guidance counselor.

PREFACE

This brochure has been specifically prepared for informational and guidance purposes. It is concerned with the development of the Carbon County Area Vocational-Technical School and its educational purpose.

The Carbon County Area Vocational-Technical School is not a separate school within the county, but is an extension of all high schools in the county. It is an integral part of all secondary school programs, offering opportunities to gain knowledges and skills of a vocational and technical nature.

The function of the Vocational-Technical School as a service center is significant in that the student will not segregate himself from his home school, but will retain all his local identity and attend the Area Vocational-Technical School on a part-time basis. The student will spend approximately fifty percent (50%) of his school time in his or her home high school and the remaining fifty percent (50%) of his school day in the Area Vocational-Technical School. General education subjects, such as science, mathematics, English, history, and physical education will be taught in the home school, while the Area Vocational-Technical School will provide instruction in practical and theoretical trade practices and techniques. This objective is to make available to all students of the county, marketable skills and vocational competencies. Students may continue to participate in extra-curricular activities of his or her home high school.

The future is bright for craftsmen, tradesmen, and technicians through service, effort, and hard work. The Vocational-Technical School offers opportunities for the youth and adults of Carbon County.

POLICIES

Student Acceptance:

The Carbon County Area Vocational-Technical School reserves the right to select students on a basis of their age and their ability to profit from instructions offered. This will be determined through multiple factors. Entering students will be required to take a battery of tests. These test results will provide information to enable students to make more realistic vocational decisions. Recommendations from industrial arts and homemaking teachers, guidance counselors, and principals, will also be given consideration. In extreme cases, enrollment will be considered on a probationary basis. Every effort will be made to meet the needs of each student. Final decision for acceptance will be made by the vocational school after consultation with home guidance staff.

Guidance and Counseling:

The Vocational-Technical School will be staffed with a Student Service Coordinator, (Vocational Guidance Counselor) who will coordinate the school's guidance program with its member schools. All pre-enrollment orientations will be carried out in the home high school. Upon registration, students will be requested to make a first, second, and third choice. Individual fitness will then be considered in course placement.

Attendance:

The most frequent question asked by employers is, "Has this student been dependable and regular in his attendance?" This is a most important factor. Good and faithful attendance will be required. Days of absence cannot be made up. Student attendance will be kept on a clock-hour basis. This procedure is used so that records will show the number of hours of training accrued during a student's attendance. This time record will be used for apprentice and licensing purposes in some areas of training.

Record Keeping:

An accurate and comprehensive system of records will be kept for each student. These will include grades, attitudes, attendance, personal characteristics, safety records, and hours of instruction.

Grading:

Grades will be issued in accordance with the home school system. Students who fall below standard will be required to upgrade their current status or be dropped from the program.

Placement Service:

The school will retain a placement service program and

will assist all students in securing employment upon graduation. The school will also work cooperatively with the Pennsylvania State Employment Service. Recommendations for employment will be based upon the student's accumulative record.

Student Dress:

Modesty and sensible dress are encouraged. Sloppy or untidy dress will not be tolerated. In some areas students will be required to wear clothing commonly worn in their trade, craft, or service.

Student Conduct:

Smoking will not be permitted. Students will be expected to conform to all the rules and regulations as established by the Vocational-Technical School. Discipline is an important phase of the student's training. Records will be kept by instructors on student attitude and behavior. These records will be important in placing a student in a job after graduation. Horse play, destruction of property, and stealing will not be tolerated. Failure to conform to these rules may result in dismissal from the Vocational-Technical School.

Safety:

The school will require that all students adhere to its

strict safety program. Students who practice faulty safety procedures will be down graded and if such practices continue, suspension from the Area Vocational-Technical School may result. The individual welfare of every student is our chief concern.

Cafeteria Service:

The Area Vocational-Technical School will provide a school lunch program. All students will be invited to take advantage of the school lunch program. Whether a student purchases his or her lunch from the school or carries it from home, eating will be permitted only in the cafeteria area.

Transportation:

Transportation to the school will be provided by school buses from every high school or vicinity.

The County School Board:

The County School Board is the legal operating and controlling authority of the Carbon County Area Vocational-Technical School.

Advisory Council:

The General Lay Committee, the Professional Committee, and the Craft Committees of the school, will act as advisory

groups to assist the County School Board in developing curriculum and operating guide lines.

Student Schedule:

A student's request for a change of course within the Vocational-Technical School must be submitted no later than the end of the first semester of his or her sophomore year. One change only will be permitted. The final decision for this change will result from a conference among the student, the instructor, guidance personnel, and the Area Technical School chief administrator.

Student Dismissal:

A student enrolled in an Area Technical School program may be required to drop his Area Technical School program and return to his home school as a result of a joint conference among the student, his instructor, the Area Technical School chief school administrator, and guidance personnel, if:

1. His attitude and conduct endanger the safety or hinder the progress of the other members of the class.
2. It becomes evident after a reasonable period of time that he will not succeed in the program in which he is enrolled and that he cannot profit therefrom.

In any event the local district chief school administrator shall be informed of such conferences and outcomes.

"He Who Hath a Trade Hath an Estate."-Benjamin Franklin

HIGH SCHOOL COURSE OFFERINGS

The Curriculum:

Auto Body Repair
Auto Mechanics
Carpentry and Cabinet Making
Chemical Technology
Commercial Art
Cosmetology
Data Processing
Distributive Education
Drafting
Electrical Construction
Electronics
Foods Preparation
Machine Shop
Practical Nursing
Welding

AUTO BODY REPAIR

With the millions of automobiles on our highways today, we must have capable men to repair cars which have been damaged. The auto body shop in the Area Vocational-Technical School has all the modern facilities to train young men for this never-ending trade of repairing and refinishing automobile bodies.

The young man who has decided to learn the body and fender repair trade is not only faced with acquiring skills with the hand tools, but he must also learn to weld, solder, shrink metal, form metal, use power jacks, frame tools, and numerous other pieces of equipment.

The bodyman and painter must be artistically inclined. He has to work with all sorts of contours and flat pieces of sheet metal. He must also be able to paint and match thousands of different shades of colors so that the damaged panel when repaired will look like the original panel.

UNITS OF WORK: Frame Straightening - Body and Fender Repairs - Refinishing - Upholstering - Glass Replacement - Spray Painting Techniques

QUALIFICATIONS: Completion of the 9th Grade
Mechanical Aptitude and Interest
Good Eyesight
Physical Stamina
Recommendation of Guidance Counselor
Recommendation of Industrial Arts Teacher

EMPLOYMENT OPPORTUNITIES:

Collision work has grown tremendously with the increased production of cars. Millions of dollars are spent every year on the repair of automobile bodies. Enlargement of car bodies and the streamlining of the sheet metal require skilled craftsmen to do repair work. For the man who has acquired the necessary skills, attractive pay and steady employment are possible.

RELATED JOBS:

Auto Painter - Metal Finisher - Industrial Spray Painter - Welder - Gas Station Owner - Sheet Metal Worker - Upholsterer - Insurance Adjuster - Auto Parts Supplier

AUTO MECHANICS

The Automotive Mechanics Program provides high school students with a working knowledge of all phases of automobile repairs and maintenance. The growing demand for trained mechanics accelerated by increased production of modern cars has opened the doors of automotive service to thousands of young men. A definite shortage of skilled mechanics now exists and all available forecasts report an ever more serious shortage in the next few years.

The objective of the Automotive Shop in the Area Vocational-Technical School is to familiarize the student with the complete automotive trade, putting the greatest emphasis on Automotive Maintenance. The student will also spend some time on the other aspects of the automobile industry as well as cover the important facts of allied trades. The automotive field employs one out of every seven people who are working in the United States today. Any boy with the determination to study, and the stamina to work hard, can advance rapidly in this field. This course is not intended for those interested in this training as a hobby.

UNITS OF WORK: Engine Tuneup Diagnosis and Repair - Chasses Maintenance - General Services and Maintenance - Chassis Repair and Lubrication

QUALIFICATIONS:
Completion of 9th Grade
Mechanical Aptitude and Interest
Willingness to Learn
Recommendation of Guidance Counselor
Recommendation of Industrial Arts Teacher

EMPLOYMENT OPPORTUNITIES:

With 72 million automobiles on the road today, the opportunities for employment in this field are very good. Good pay and working conditions attract many mechanics, but lack of technical training prevents even higher wages and greater advancement. Training in this area may also lead to other types of related employment.

RELATED JOBS:

Automobile Salesman - Specialty Mechanic - Shop Foreman - Service Manager - Gas Station Owner - Auto Parts Manager - Auto Mechanic Teacher - Insurance Adjuster

CARPENTRY AND CABINET MAKING

Carpentry is one of the largest single construction trades. The work of a Carpenter is quite extensive, including: form work, frame work, roofing, staircase, mill work, and in some instances, extends into the field of cabinet making. The cabinet maker is essentially a worker who performs such jobs as cutting, shaping, and assembling high grade articles of furniture. However, in both cases the carpenter and cabinet maker must have knowledges and skills in the use of both hand and machine woodworking tools and equipment.

The objective of this program is to provide the student with a well-rounded program that will allow him to specialize in either the field of carpentry or cabinet making.

UNITS OF WORK: Reading Plans and Blue Prints - Cost Estimating - Fundamental Use of Hand Tools - Fundamental Use of Woodworking Machines - Framing - Roofing - Exterior Finish - Interior Finish - Fundamentals of Cabinet Making - Wood and Lumber Identification and Grading

QUALIFICATIONS:
Completion of 9th Grade
Mechanical Skill
Physical Stamina
Safe Working Habits
Ability to Read Drawings
Recommendation of Guidance Counselor
Recommendation of Industrial Arts Teacher

EMPLOYMENT OPPORTUNITIES:

The outlook is excellent for skilled carpenters in the construction industry. Jobs can be found with contractors, lumber companies, and governmental agencies.

RELATED JOBS:

Cabinetmaker - Carpenter - Furniture Maintenance and Repair - Model Making - Mill Work - Machine Operations - Floor Layer - Estimator - Roofer - Painter

CHEMICAL TECHNOLOGY

The student specializing in this area may work with industrial chemists or chemical engineers in the development, production, and use of chemical products and equipment. Chemical technologists may assist in the conduction of experiments to analyze various characteristics of different substances. They may also perform tests to determine whether particular substances are present and if so in what quantity. Modern electronic equipment will be used in the study of chemical principles.

UNITS OF WORK: Elements of Chemistry - Elements of Physics - Qualitative Analysis - Analyses by Instrumentation - Introduction Research

QUALIFICATIONS:
Completion of 10th Grade
Above Average Ability in Mathematics
Above Average Ability in Science
A Strong Interest for Analytical Type Work
Recommendation of Guidance Counselor

EMPLOYMENT OPPORTUNITIES:

Employment opportunities are excellent. The chemical industry is expanding rapidly and skilled chemical technologists are in great demand. The largest number of chemical technicians are presently employed in research work.

RELATED JOBS:

Chemical Salesmen - Control Analysts - Laboratory Supervisors - Laboratory Technicians - Research Assistant

COMMERCIAL ART

The field of commercial art is wide and varied. It includes drawing and designing illustrations for advertising copy, books, magazines, and newspapers. Also, creating designs for billboards and posters. Technical illustrators, retouch artists, layout and paste up artists, medical illustrators, animators, cartoonists, lettering artists, package designers, sign painters, and designers, display designer, and photographic material are all forms of commercial art.

The major emphasis for the young men and women trained for these skilled jobs is placed on manual accomplishments in the skills of art production, technical features of composition, display, color theory, and many others.

UNITS OF WORK: Lettering - Sign Painting on Various Materials - Silk Screen Processes - Displays - Illustrations - Watercolor and Poster Techniques - Anatomy - Commercial Art Practices

QUALIFICATIONS:
Completion of the 9th Grade
Must have Ability in Creative Art and Design
Must Submit a Portfolio of Art Work
Must Show Aptitude and Interest for this Training
Recommendation of Guidance Counselor
Recommendation of Art Teacher

EMPLOYMENT OPPORTUNITIES:

There are wide ranges of opportunities in this field. The beginner may find employment as a sign painter, letterer, or show card writer. The more experienced artist may work for himself as a free lance artist.

RELATED JOBS:

Silk Screen Worker - Retoucher - General Art Worker - Sign Painter - Illustrator - Designer

COSMETOLOGY

Cosmetology is the scientific study of beauty culture, such as the care of the skin and hair, personal and public hygiene, bacteriology, sanitation, and sterilization. After having satisfactorily completed this course, an individual will have learned to observe all rules of hygiene and sterilization which meet State requirements. Also, they will be prepared to take the State examination for a practicing license.

Certain personal and physical characteristics are required of workers in this field. A pleasing personality and the ability to establish and maintain friendly relationships with people are of particular importance.

UNITS OF WORK: Scientific Fundamentals of: Hygiene - Sanitation - Sterilization - Bacteriology - Anatomy and Physiology of Various Systems Relative to the Head, Face, Neck, Arms, and Hands - Shop Management - Study of State Laws and Regulations in Preparing for the State Examination

QUALIFICATIONS:
- Completion of the 9th Grade
- Satisfactory Health Record
- Interest in Cosmetology as a Wage Earning Occupation
- Personal Cleanliness and Neatness
- Recommendation of Guidance Counselor
- Recommendation of Home Economics Teacher

EMPLOYMENT OPPORTUNITIES:

Employment opportunities for cosmetologists are good. This is due to a high turnover and a continued growth in the number of women who avail themselves of these services. Many beauty operators with enough skill, business ability, and capital have successfully opened their own shops.

RELATED JOBS:

Manicurist - Barber - Hair Stylist - Wigmaker - Beauty Shop Operator - Instructors

DATA PROCESSING

Business decisions are based upon information about sales, accounts, income, and expenditures. This information is called data. The collecting, analyzing, summarizing, and reporting of this information is called Data Processing.

Instruction is provided in the operation of electronic data processing machines. Emphasis will be placed on systems and procedures rather than specific machines and their limited operation. The areas covered will be: Coding, Computing, Sorting, Summarizing, Recording, and Communicating.

UNITS OF WORK: Functional Wiring Principles - Business Machines - Numbering Systems - Fundamentals of Programming - Communicative Skills - Accounting - Industrial Organization & Management - Introduction to Data Processing Systems - Statistics

QUALIFICATIONS:
Completion of the 11th Grade
Above average Mathematical Aptitude
Successful Completion of Entrance Examination
Recommendation of Guidance Counselor
Recommendation of Business Teachers

EMPLOYMENT OPPORTUNITIES:

Employment in this field is excellent. Business and industry are constantly studying ways and means to increase their efficiency in the handling of various kinds of data. Other organizations such as education and law enforcement agencies are likewise converting to Data Processing.

RELATED JOBS:

Computer Programmer - Data Processing Technician - Systems Analyst

DISTRIBUTIVE EDUCATION

Distributive Education is primarily selling; however, it also includes such areas as buying and pricing, business operations, advertising, commercial law, and accounting. Occupations in this field are varied, but in most cases it will involve meeting and working with people.

The program is a cooperative enterprise using both the facilities of the school and the marketing and merchandising resources of the community. Supervised "on-the-job" training will be provided by cooperating businesses in the area. A student will spend approximately half of his vocational school time working in a store and the rest of the time will be devoted to classroom instruction.

UNITS OF WORK: Economics of Distribution - Advertising - Store Organization - Salesmanship - Management and Good Will - Interior and Window Display - Business Management - Retail Mathematics - Textiles - Retailing Laws - Merchandising

QUALIFICATIONS:
Completion of the 11th grade
16 years of Age
Written Consent of Parents
Good Attendance and Punctuality Record
Desire to Enter the Field of Distribution
Desire to Meet and Work with People

EMPLOYMENT OPPORTUNITIES:

Employment in areas covered by Distributive Education is excellent. In Pennsylvania, one out of every five persons is working in this field. Opportunities for selling are everywhere. If a student shows initiative and imagination, there is no limit to how far he may advance.

RELATED JOBS:

Sales Clerk - Buyer - Cashier - Store Manager - Stock Supervisor - Fashion Assistant - Window Trimmer - Advertising

DRAFTING TECHNOLOGY

Drafting Technology is a program that offers training for the draftsman at a technical level. This draftsman is one who will work at a level between the engineer and the skilled draftsman. He will generally work from sketches, specifications, or from notes as furnished by the engineer or architect, transforming them into work plans and detailed drawings for the skilled draftsman. This technician will be required to make calculations concerning strength, quality, and cost of materials to have an appreciation and understanding of the elementary elements of design and engineering. Instruction is given in the use of all equipment typical of that found within leading drafting and design rooms.

UNITS OF WORK: Work Drawings - Pictorial Drawings - Assembly Drawings - Technical Illustration - Elements of Architectural Drawing - Design Principles - Theoretical Aspects of the Trade

QUALIFICATIONS:
Completion of the 9th Grade
Average or above Math Ability
Mechanical Aptitude
Average or Better Grades in Other Subjects
Recommendation of Guidance Counselor
Recommendation of Industrial Arts Teacher

EMPLOYMENT OPPORTUNITIES:

Technical level draftsmen are in short supply. Employment opportunities are excellent. Advanced training programs are now available in two-year colleges.

RELATED JOBS:

Drafting Technician - Design Technician - Assembly Detail Draftsman - Technical Illustration

ELECTRICAL CONSTRUCTION

This course is a broad, basic, well-balanced program in practical electricity. A student is taught to install electrical wiring, switches, lighting fixtures, and numerous types of electrical equipment. Practical experience and knowledges in the field of armature and motor repair and rebuilding are a feature part of this course. Such phases of electrical work as magnetic switches, holding coils, transformers, transformer ratios, and home and industrial wiring are also covered. This training will enable a student to work as a construction electrician of a maintenance electrician.

Most construction electricians work for electrical contractors. Substantial numbers are self-employed. Others work for government agencies or business establishments.

UNITS OF WORK: Direct Current Theory - Alternating Current Theory - Signal Wiring - Light Wiring - Power Wiring - Motor Connecting and Repair - Trouble Shooting - Power Control

QUALIFICATIONS:
Completion of the 9th Grade
Average or Above Average Mathematical Ability
Average Reading Ability
Some Mechanical Aptitude
Recommendation of Guidance Counselor
Recommendation of Industrial Arts Teacher

EMPLOYMENT OPPORTUNITIES:

Increased building construction will mean increased job opportunities for all forms of electrical installation. Electrical appliance service and repair will also offer many job opportunities.

RELATED JOBS:

Appliance Repairman - Cable Splicer - Lineman - Motor Rewinder - Electrical Equipment Salesman

ELECTRONICS TECHNICIAN

This is not a course in television or radio repair. Electronic technology is the study of basic electrical laws and concepts, simple and complex electrical circuits, communications, telemetering, and micro waves. The course is designed to develop an understanding of the principles involved in industrial automation and advanced forms of communication. The electric eye, zonar, radar, television, and many other technological advances are all part of electronic theory. Electronic technicians work with engineers and scientists in a great variety of projects.

A technician, with special training in electronics, may work in industrial electronics, missile development, nuclear power, communications, automation, instrumentation, radio and television.

Advanced training in this area is now available in two-year junior colleges.

UNITS OF WORK: Basic Electric Currents - Electronic Principles - Use of Testing and Recording Instruments - Fundamentals of Rectifier Circuits - Properties of Tuned Circuits - Principles of Communication - Principles of Industrial Electronics

QUALIFICATIONS:
- Completion of the 9th Grade
- Successful completion of Algebra I
- Above Average Ability in Mathematics
- Average or Better Grades in Other Subjects
- Average or Better Reading Ability
- Willingness to Work Hard and to Study Difficult Material
- Recommendation of Guidance Counselor
- Recommendation of Math Teacher

EMPLOYMENT OPPORTUNITIES:

Employment opportunities for qualified technicians are excellent. The Electronics field is expanding tremendously. Jobs are available in industrial electronics and also the field of communications.

RELATED JOBS:

Communications Technician - Television and Radio Repair - Engineering Aid - Electronic Business Machine Repair - Medical Electronic Technician - Electronic Assemblier

COMMERCIAL FOOD PREPARATION

As our society becomes more mobile and the problem of travel and transportation reduced to what it is today, there is an increased demand for personnel in the Commercial Food Trades. Gourmet cooking, service, and preparation of foods has now become a major area of employment.

This course in quantity foods preparation offers training in all aspects of food preparation and service. The program of instruction will follow a planned procedure through the presentation of theoretical instruction in subjects such as principles of cookery, baking, accounting, and the purchasing of foods. This will be followed by individual practical application through the student cafeteria and the faculty cafeteria of the Area Vocational-Technical School. Under the direction of the instructor and with the assistance of professional personnel, it will be the responsibility of the students within this class to plan for and prepare all meals served within the school facilities.

UNITS OF WORK: Orientation - Sanitation - Care, Maintenance, and Operation of Equipment - Safety - Waiter and Waitress Service - Recipes and Formulas - Food Costs - Nutrition - Food Preparations

QUALIFICATIONS:
- Completion of the 9th Grade
- Average Scholastic Ability
- A Keen Interest in Foods Preparation and its Service
- Satisfactory Health Record
- Recommendation of Guidance Counselor

EMPLOYMENT OPPORTUNITIES:

Employment opportunities for competent chefs, cafeteria managers, restaurant, and dining room managers are increasing annually. In as much as this program is located near the Pocono Mountains resort areas, employment opportunities are good.

RELATED JOBS:

Waiter - Chef - Short Order Cook - Meatcutter - Food Packager - Caterer - Restaurant Manager - Restaurant Owner

MACHINE SHOP

This has been called the Atomic Age, the Technological Revolution, and the Electronic Age. Call it what you may, this area is maintained by machines. Practically all necessities of life are made by machines. The atomic bomb and all electronic equipment used in war as well as peace are made either in part or completely by machine tools.

In factories, food stuffs are refined and prepared, fabrics are woven, and wool and metal are fitted together to make the furnishings of civilization. Everywhere, factories are building laborsaving devices for the education, recreation, and prosperity of the people. But without the machinist there would be no engines or dynamos to furnish power. There would be no machines because the machinist is the producer of them all.

UNITS OF WORK: Hand, Bench and Assembly Work - Machine Operation - Lathe - Drill Press - Shaper - Milling Machine and Grinding - Tool and Cutter Grinding - Heat Treatment of Metals - Elementary Tool Making (Jig and Fixture)

QUALIFICATIONS:
Completion of 9th Grade
Mechanical Aptitude and Interest
Good Background in Math and Mechanical Drawing
Patience to Work with Painstaking Accuracy
Good Eyesight
Physical Stamina
Recommendation of Guidance Counselor
Recommendation of Industrial Arts Teacher

EMPLOYMENT OPPORTUNITIES:

Skilled machinists are in great demand. Working conditions vary from the building of heavy machines to fine precision die work. Most shops operate on an eight-hour day, and a machinist working on a job requiring a high degree of accuracy receives higher pay than one producing rough work.

RELATED JOBS:

Machine and Tool Designer - Specialized Machinist - Bench and Floor Machinist - Inspector - Assembler - Tool Room Attendant - Machine Tool Operator - Welder

PRACTICAL NURSING

The practical nurse plays a vital role in the health activities of a community. Many of the functions formerly performed by a professional nurse are now performed by a practical nurse. This includes taking temperatures and giving certain routine treatments. These nurses work in institutions as visiting nurses, with visiting nurse associations, and in homes. They work under the general direction of a licensed physician or the supervision of a registered professional nurse. In actuality, the practical nurse helps to ease the suffering of the ill, helps those who cannot help themselves, and comforts and cheers the troubled.

This course is broken down into two major divisions: pre-clinical instruction and clinical instruction. The technical school gives the pre-clinical instruction and a cooperating hospital gives the clinical instruction. Since a practical nurse must be 18 years or older, she receives her clinical instruction after graduation from high school.

UNITS OF WORK: Personal and Vocational Relationships - Personal and Community Health - Nursing Skills and Theory - Foods and Nutrition - Medical Nursing - Surgical Nursing - Maternity - Pediatrics - Recovery Room - Diet Kitchen

QUALIFICATIONS:
Completion of the 11th Grade
Satisfactory Health Record
Neat Personal Appearance
Ability to Get Along with Others
Recommendation of Guidance Counselor

EMPLOYMENT OPPORTUNITIES:

The practical nurse is continually in demand, due to the increase in population and the overcrowding of hospitals. Since patients are discharged so early from hosptials after surgery or childbirth, the convalescent period at home requires a nurse. Nursing homes, public health agencies, industries, and businesses find the employment of a trained practical nurse essential.

RELATED JOBS:

Orderly - Nurses Aide - Medical Technician - Medical Assistant - Registered Nurse

WELDING

Welding mechanics may be found in a wide range of industries. Welding involves the joining of metals by using either an electric arc or gas welders. Gas cutting equipment is also used to cut metal to size or shape. A welder must be able to make various kinds of welds in different metals, working from different positions. It is essential to have a knowledge of welding symbols and the ability to operate, adjust, and control equipment.

Instruction is given in the welding of aluminum and stainless steel using the heliarc equipment, gas cutting of metals, and also gas and arc welding. The student receives practice in arc welding, making various types of joints, various kinds of electrodes, and various gauge metals. Through this practice he learns graze and fusion welding, and flame cutting. Safe working practices are stressed.

UNITS OF WORK: Arc Welding - Fillet Welding - Causes of Welding Failures and their Remedies - Welding Symbols - Various Types of Metals and their Characteristics - Gas Welding - Equipment Demonstrations - Safe Working Practices - Theory and Related Information

QUALIFICATIONS:
Completion of 9th Grade
Mechanical Aptitude and Interest
Manual Dexterity
Good Eyesight
Guidance Counselor Recommendation
Industrial Arts Teacher Recommendation

EMPLOYMENT OPPORTUNITIES:

Employment opportunities for welders are very good. The leading employers of welders are those making machinery, automobiles, ships, aircraft, boilers, tanks, and fabricated structures. Openings for welders are also available inall metal fabrication industries such as steel mills and aluminum plants. Many welders have their own local repair shops.

*ADULT VOCATIONAL EDUCATION; STATE SURVEYS; GRADUATE SURVEYS; *VOCATIONAL FOLLOWUP; *PROGRAM EVALUATION; PROGRAM EFFECTIVENESS; *FEDERAL PROGRAMS
*MANPOWER DEVELOPMENT AND TRAINING ACT PROGRAMS; MDTA PROGRAMS; NORTH DAKOTA

All of the 637 graduates of Manpower Development and Training Act institutional training programs in North Dakota between October 1962 and September 1966, who had been in the labor market for at least 1 year, were mailed questionnaires to aid in analyzing the training's effectiveness. All of the graduates were unemployed prior to training and most were from rural areas and small cities. Over 60 percent (388) of the questionnaires were returned, and a random sample of 34 (14 percent) of the non-respondents was located to complete the questionnaire. The non-respondent data was compared to respondent data to be certain that a biased sample did not exist. Some conclusions of the survey and of personal contacts with both graduates and teachers were: (1) 93.56 percent of the graduates were employed, (2) Graduates' hourly wages were higher than could be expected for untrained workers, (3) Graduates employed out-of-state received the highest wages, (4) The training provided a means for the trainee to explore related occupations, and (5) Graduates employed in trade and industrial and technical occupations earned higher hourly wages than did those employed in other fields. Appendices contain statistical tables and copies of the questionnaire and cover letters. (ET)

ACKNOWLEDGEMENTS

The authors wish to acknowledge the help and assistance of the persons who participated in the conduct and publication of this study. Special thanks are extended to Miss Carol Maynard for her assistance in contacting the respondents and mailing the questionnaires and to the North Dakota State Employment Service for their assistance in providing the names of the respondents.

A special thanks also should be given to Donald J. Fixel and Jerry B. Wolfe for their countless hours of work in the summary and statistical analysis of data. In addition, both Mr. Fixel and Mr. Wolfe participated in the preliminary writing of much of the report.

Special thanks are extended to Mr. Edward F. Wood for his assistance in the analysis and interpretation of data and for his assistance in the preparation of the final report.

Appreciation is extended to Mr. LeRoy H. Swenson, State Director of Vocational Education, and the State Board for Vocational Education for their cooperation in the conduct of the study and for providing funds and staff time.

Finally, special thanks are extended to Mrs. Diane Cartwright for her efforts in coordinating, editing, and typing both the preliminary drafts and the final manuscript.

Lyle S. Evenson

Frank N. Fischer

FOREWORD

This research report presents the results of a systematic, organized effort to evaluate the effectiveness of the institutional part of the Manpower Development and Training Act programs in North Dakota. The study was initiated by Mr. Frank Fischer and Mr. Lyle Evenson of the State Vocational Education staff. The Center for Research in Vocational and Technical Education became involved in the study soon after its inception and agreed to assume the tasks of data analysis and report preparation. The cooperation and mutual assistance provided by both the State Vocational Education staff and the Center for Research has indeed proved beneficial to both parties and has demonstrated the feasibility of such cooperation on research projects.

The study reported herein is unique in that it is a normative survey which has built into the design the means for determining the population parameters without actually receiving 100 per cent returns. The design consisted of conducting a mail survey questionnaire sent to the total population, followed by a ten per cent random sample of those persons who did not respond to the mail questionnaire. The process of surveying a random sample of the non-respondents provided the researchers with very accurate estimates of the total population.

The reader of this report will become aware of some of the successes and failures of the MDTA institutional programs. The research evidence presented in this report should be useful in the planning and

conduct of future MDTA programs. The reader should be cautioned, however, that the information is based only on programs conducted in North Dakota and then only on those graduates of the institutional MDTA programs.

CHAPTER I

INTRODUCTION

Background

In early 1962, when Congress passed the Manpower Development and Training Act, our national economy was characterized by severe unemployment, with several million jobless persons available for work. At the same time, employers were posting thousands of unfilled jobs. The MDTA program was designed to help these unemployed workers qualify for jobs and to provide the trained workers needed by the nation's employers. Its training program was established to provide the opportunities for workers whose occupations had become obsolete to attain new skills, to assist young people with little or no skills or job experience to enter the world of work, and to attack the special employment problems of the disadvantaged.

The objectives of the MDTA program have evolved both from the intent of the original act and as a result of experience with the program. The objectives, as identified by Garth L. Magnum[1] are:

1. Facilitating employment of the unemployed
2. Reducing poverty
3. Lessening inflationary pressures
4. Meeting labor shortages

---

[1]Magnum, Garth L., Contributions and Costs of Manpower Development and Training, Institute of Labor and Industrial Relations and National Manpower Policy Task Force, December, 1967, p. 7.

5. Upgrading the labor force

6. Revamping traditional institutions

The act was responsive to a need created by a number of economic developments: the emergence of new processes and products and the decline of older ones; the introduction of automation and other technological processes to many plants; shifts in plant location and market demand; the effects of foreign competition; and the entry of almost unprecedented numbers of youth into the job market.

One of the most pervasive job market developments has been the gradual upward shift in the occupational requirements of the nation's employers. Partially as a result of the impact of new technologies, there has been a steady decline in the number of jobs for unskilled and semiskilled workers and a rapid rise in the opening for skilled, technical, and professional workers.

At the Federal level responsibility for carrying out the provisions of the MDTA is divided between the Department of Labor and the Department of Health, Education, and Welfare. At the State level, in North Dakota, it is divided between the North Dakota State Employment Service (NDSES) and the State Board of Vocational Education (SBVE). Local operations are delegated to the schools that conduct the training and local office managers of the NDSES.

The organization of the program in North Dakota is as follows:

1. Local operations are delegated to schools or training agencies within the state that conduct the training by the North Dakota State Vocational Education staff. The trainees are selected by the North Dakota State Employment Service.

2. The institutional training part of the program is under the

supervision of the State Director for Vocational Education.

3. The State has a Manpower State Supervisor who handles the administration of MDTA.

4. A State MDTA Advisory Committee of seven members, appointed by the Governor, while maintaining a liaison with the National Advisory Committee, reviews and evaluates the State's overall Manpower program plans and makes recommendations to the Governor relative to carrying out the state plan. The committee recommends occupational training and skill development programs appropriate to the state's needs and resources; exercises general review and appraisal of those programs; and brings its prestige to bear in achieving public support of and participation in the state's Manpower Development and Training Programs. In performing its duties and responsibilities, the committee may seek the advice of outside professional and technical specialists.

Need for the Study

Adequate evaluation of the contributions of MDTA requires not only an assessment of the extent to which the program as a whole has accomplished its objectives, but also an assessment of the degree to which various program components have contributed to those objectives. Since the war on poverty has been going on for several years, it seems that the positive effects of MDTA's part in that war should be evaluated in an effort to measure the positive and negative effects of the program.

The present study differs from the three month, six month, and 12 month follow-up studies conducted by the State Employment Service by including in the study only those graduates who have been in the

market for at least one year. As such, this study is one of the first of its kind in the nation and is somewhat dependent on a pioneer approach to evaluation. Some of the relevant items requiring evaluation, however, seem apparent. Does retraining help a person get a job or upgrade his job skills? Does the return justify the expense? In what ways could the training program be made more beneficial and efficient? An additional reason for a follow-up study of this nature is to learn something of the social and employment status of the people trained in the program. Relevant factors here are: employment status, are they unemployed, what kinds of jobs do they hold; are they employed in-state or out-of-state; what range of wages do they make; how many hours do they work; and if possible, some qualitative factors about their lives--things that may have happened to them since and possibly because of the Manpower Development Training. Such information is vital to a full understanding of the total picture of a person's vocational life.

Statement of Problem

The central problem studied was the effectiveness of the institutional MDTA programs in North Dakota. Effectiveness was measured by ascertaining specific information about the graduates of the programs. The types of information secured included employment vs unemployment, type of employment, level of wages, and place of employment. The study included all of the graduates of the institutional MDTA programs who had been out of the program and available for employment for at least one calendar year. Information was gathered by means of a mail interview technique.

Definition of Terms

The MDTA graduates for this study are defined as those persons who completed training during the period of October 1962, when the program began, and September 1966. Thus the graduates had all been in the job market after their period of training for at least one year. The facilities used for training were both public and private training facilities in North Dakota and many programs in other states that were available to trainees from North Dakota. These out-of-state institutions were used for what were termed slot-in or less than class-groups as well as for class groups. The enrollees in the program were categorized as follows: (1) unemployed workers and family farm workers with less than $1200 annual net family income, (2) persons working substantially less than full time, (3) persons who will be working less than full time or will be unemployed because their skills have become or are becoming obsolete, (4) persons working below their skill capacities, (5) youths between the ages of 16 and 22 years of age.

This study is also concerned with cost benefit. There must be some realistic way of measuring the effects of such programs. Cost-effectiveness should look at the tax consideration. By raising a person's level of education according to his training, will his increased tax potential pay back the cost of the initial training program? another question to be answered, are the funds for the MDTA justified by the increased tax returns which are the result of better training through MDTA?

All of the people who went through MDTA in North Dakota during the period of this study were not merely under-employed, they were

unemployed. They were in most instances drawing unemployment compensations, were possibly on County welfare or in some other way being supported by tax dollars - either local, state or Federal. These persons were a drain on the economy, taking productive dollars out of the economy and putting nothing back into it. In order to combat this, MDTA was instituted.

The information gained from this study will hopefully give us some idea of the cost benefit that the MDTA program has provided. One will be able to compare the tax dollars spent to keep these people alive in our society with the amount of tax dollars that now these people are returning from the wages they have earned. There are many other factors to be considered: the people who were involved in helping these previously unemployed people are now free to devote their time to helping other people. We now have also a larger trained manpower pool. There are more people now to produce the goods and the services that are vital to our economy. These, then, are some of the cost benefit items.

Limitations

The primary limitation of this study was North Dakota. The numbers and kinds of training programs available were limited to citizens of North Dakota. There was a sociological and ecological factor operating here; most of the people were from rural areas and small cities. Also, the work ethic typical of the midwestern section of the United States limited the applicability of the results.

The general limitations of a mailback questionnaire methodology must also be considered. The difficulty of interpreting some of the

items on the questionnaire by both the respondents and the researchers and the lack of a 100 per cent response also limited the interpretation and conclusions of the survey.

CHAPTER II

DESIGN AND METHODOLOGY

Sampling Procedure

The subject pool for the study consisted of all the graduates from North Dakota MDTA institutional programs during the period of October 1962 to September 1966. This subject pool contained 637 persons who had graduated from the program. It was decided to limit the study to those graduates who had been in the labor market at least one year in order to ascertain the effects of the training that persisted over a period of time. It was decided to include all of the graduates in the sample. The subjects were a heterogeneous group with only one factor in common: they were all unemployed prior to MDTA training.

Each of the subjects was contacted by means of a mail questionnaire. The questionnaires were returned to Bismarck. Those people who did not respond on the initial mailing were again contacted by mail and asked to respond. Two more similar mail follow-ups were also conducted. After all these questionnaires were received, a random sample of the non-respondents was surveyed in order to ascertain whether or not there was any significant difference between those who did and those who did not respond. If no significant differences appeared, the results obtained from the 388 questionnaires received could be generalized to the entire group of 637. The results of the study of the

non-respondents is reported in Chapter III.

Instrumentation

The data were collected by means of a 19 item mail questionnaire which was developed by members of the State Vocational Education staff. The questionnaire contained certain personal items identifying the person and his place of employment as well as items pertaining to hours, wages, and other information about the graduates' feelings toward their MDTA training. A copy of the instrument as well as the cover letters used are included in Appendix A.

The data were of a nominal nature with the exception of wages and hours. Some of the data consisted of specific write-in responses, hence, descriptive (non-parametric) statistics such as frequency distributions and chi-squares were chosen as appropriate techniques applicable to this data. The wage and hour data (ratio data) were treated by an analysis of variance technique.

Special Treatment of Data

Of the 637 questionnaires originally mailed in June 1967, 388 or 60.9 per cent were utimately returned by January 1968, in response to mailed reminders. Each of the 388 questionnaires was then placed into one of four groups on the basis of an arbitrary cut-off date of reception in Bismarck. The first group contained 231 questionnaires, the second group 92, the third group 28, and the fourth group 37.

To determine whether or not the data from each of the four groups were not dissimilar enough to preclude the pooling of data into a single general summary, statistical tests, performed before receipt at the Research Coordinating Unit of the final 17 questionnaires, were

conducted on the information obtained from items 5, 16, and 17. The information contained in these items was considered to be of prime interest to the initiators of the project and therefore crucial to any attempt to compare the data of the groups with each other. Considering trends over the four groups, the following questions were asked. Was there a statistically significant difference: (1) in the questionnaire return rate between respondents employed in-state versus those employed out-of-state; (2) in the return rate of respondents employed in the field for which they were trained versus those employed in different fields or unemployed; (3) in the return rate of respondents who were employed versus those not employed; (4) in mean (i.e., average) hourly wages earned by respondents employed in-state versus those employed out-of-state; and (5) in mean number of hours worked per week by respondents employed in-state versus those employed out-of-state?

The answer to all these questions was found to be negative. Certain characteristics of each of the four groups as indicated by responses, were found too similar to prohibit the pooling of data for the groups into a single summary. The groups were comparable, and produced no statistically significant differences on the five questions asked over the four mailings, therefore, it was decided to pool the four groups into one group; see Appendix B.

CHAPTER III

A STUDY OF THE NON-RESPONDENTS

Rationale and Design

The primary purposes of normative surveys generally are to determine the status of some particular entity or to measure the results of some action. The study being reported herein is no exception. Most surveys, however, result in something less than a complete picture due to limited samples and incomplete returns. The present study also suffers from a less than 100 per cent return but a major effort was made to ascertain the true parameters of the population studied.

The audience surveyed for the study consisted of the total population. In other words, questionnaires were sent to every person who completed MDTA programs during the period being studied. In spite of the fact that the response rate was in excess of 60 per cent, one still wonders about the accuracy of the data gathered in terms of the total population. A 60 per cent return indicated that the sample might have been biased. This chapter reports an attempt to determine in what ways and how much this sample was biased.

The authors decided that a study of those persons who did not respond to the mail survey would be conducted. A random sample equal to 14 per cent of those persons who had not responded was drawn. The individuals were located by telephone, using a variety of methods

including help from police, relatives, and many state agencies, and asked to assist in the study by completing the questionnaire and returning it to the state MDT office. The results of the questionnaires returned by non-respondents provided the researchers with evidence concerning the characteristics of that portion of the population. Knowledge of the characteristics of those who responded to original request plus a sample of non-respondents enabled the researchers to make more accurate statements about the total population.

Analysis and Results

There were 34 persons identified by the random sample method to be included in the study of the non-respondents. The persons were located and requested to complete the same instrument that had been used for the main study. Each of the 34 persons complied with this request and the results were analyzed in the same manner by the same persons who analyzed and tallied the main study.

Statistical procedures appropriate to testing each of the hypotheses were selected. The tabulation of the results of the questionnaires and the computation of the statistical tests were completed by two researchers working independently.

Hypotheses formulated to test for differences between the two groups (respondents and non-respondents) and stated in the null form were:

Null Hypothesis No. 1.--There is no difference in the rate of unemployment between respondents and non-respondents among the graduates of North Dakota MDT programs.

Analysis of Hypothesis.--This hypothesis was tested by computing

a chi-square as shown in Appendix C. The chi-square value of 2.20 was not significant. The results indicated no difference in the unemployment rates of the graduates in the respondent and non-respondent samples.

Null Hypothesis No. 2.--There is no difference in the proportion of graduates employed within and outside of North Dakota between the respondents and non-respondents among the graduates of North Dakota MDT programs.

Analysis of Hypothesis.--This hypothesis was tested by computing a chi-square for a 2 x 2 table as shown in Appendix C. The chi-square of 5.01 with one degree of freedom was significant at the .05 level. The results indicate that there are significantly more persons employed outside of North Dakota in the non-respondents sample than in the respondents sample.

Null Hypothesis No. 3.--There is no difference in the rate of employment in occupations for which trained between respondents and non-respondents among the graduates of North Dakota MDT programs.

Analysis of Hypothesis.--This hypothesis was tested by computing a chi-square as shown in Appendix C. The chi-square value of 1.53 was not significant. This result indicated no difference in the ratio between people employed in the job for which they were trained and those not employed in the job for which they were trained for the respondent sample as compared with the non-respondent sample.

Null Hypothesis No. 4.--There is no difference in the average

hourly wage reported betwen respondents and non-respondents among graduates of North Dakota MDT programs.

Analysis of Hypothesis.--This hypothesis was tested by a two-way analysis of variance technique as indicated in Appendix C. The resultant F ratio of 52.38 was significant at the .001 level which indicated a significant difference in the wages of persons employed in-state compared with those out-of-state. The F ratio of 10.00 was significant at the .005 level which indicated a significant difference between the respondent and non-respondent samples. The interaction F ratio of 6.81 was significant at the .01 level.

Null Hypothesis No. 5.--There is no difference in the average number of hours worked per week between the respondents and non-respondents among graduates of the North Dakota MDT programs.

Analysis of Hypothesis.--This hypothesis was tested by a two-way analysis of variance technique. The results are contained in Appendix C. None of the F ratios approached significance. These results indicated no difference in the mean number of hours worked per week when comparing persons employed in North Dakota with persons employed in other states or when making comparisons between graduates in the respondent and non-respondent samples.

Conclusions

Analysis of the data collected from the non-respondents indicated that the non-respondents did not differ from the respondents when selection biases were taken into account. The difference identified: (1)

proportion employed outside North Dakota, and (2) mean hourly wage, were attributed to a selection process. Persons employed outside North Dakota were more likely to be included in the non-respondents because of delays in mail delivery and difficulty in ascertaining the person's correct address. Persons employed outside the state were expected to receive higher wages as reported in the respondent sample. The differences between the two groups was a result of a selection process and was not considered detrimental to the generalizability of the findings.

The non-respondent group did not differ greatly from the respondent group. Therefore, the findings obtained by analyzing the 388 questionnaires included in the main (respondent group) study may be taken as a valid picture of the typical North Dakota MDT graduate even though less than 100 per cent of the graduates completed the questionnaire.

CHAPTER IV

RESULTS OF ANALYSIS AND DATA

The 388 questionnaires which were returned by February 1, 1968 were summarized by hand tallying. An analysis sheet was developed for each of the items in the questionnaire. Responses were recorded as simple frequencies except in the case of open-ended items where responses were listed and collapsed into categories. Due to a lack of response to some items, Ns were computed separately for each question.

A list of the course titles grouped in six occupational categories appears in Table 1. This grouping was used in analyzing the data in all instances where a breakdown by occupational categories was required. Table 2 indicates by category the nuumber and per cent of responses. The highest rate of returns (77.6 per cent) came from persons who had received training in the technical occupations. The return rate for the total study was 60.9 per cent. The additional 34 returns from the non-respondent study were not included in any results presented in this chapter.

The data presented in Table 3, Employment Status of MDTA Graduates by Occupational Category and Place of Employment, indicated whether or not the graduates were employed in the job for which they were trained. The data also indicated the number and per cent of the MDTA graduates that were unemployed. There were only 25 persons

(6.44 per cent) out of the total respondents (388) who were in the labor market and unemployed. The rate of unemployed ranged from 1.92 per cent to 10.0 per cent across the occupational categories. The total unemployment percentage however was 6.44 per cent. The sixteen persons not reported in the labor market included those who had married or had young families and were not available for employment.

The data presented in Table 4 indicated the mean hourly wage received by the MDTA graduates in each of the occupational categories as well as the mean number of hours worked per week. The highest mean hourly wages ($3.10 per hour) were earned by trade and industrial graduates who were employed outside the state. The lowest wages ($1.83 per hour) were earned by the graduates employed in agricultural occupations who also worked the highest mean number of hours per week (63 hours per week).

Responses to item six in the questionnaire are presented in Table 5. An interesting note was the method of securing the first job most often reported was "personal effort." The least used source for securing a job was answering advertisements.

Table 6 presents the reasons given by the respondents for being employed in an occupation other than the one for which they were trained. The most prevalent reasons for changing seemed to be that they got a better job or higher wage, something better than the entry level job for which they were trained under the MDTA program.

As can be seen in Table 7, the graduates felt that the relationship between skill development and technical knowledge was about right. Table 8 lists in rank order the areas of difficulty experienced by the graduates.

TABLE 1

TITLE OF MDTA COURSES INCLUDED UNDER SIX OCCUPATIONAL CATEGORIES

Health	Office & Clerical	Technical	Trade & Industrial	Agricultural	Miscellaneous
Licensed Practical Nurse	Bookkeeper	Draftsman	Arc & Acetylene Welding	Farm Hand General I	Barber

TABLE 7

RECOMMENDATIONS OF MDTA GRADUATES CONCERNING THE RELATIONSHIP BETWEEN TECHNICAL KNOWLEDGE AND SKILL DEVELOPMENT BASED ON THEIR TRAINING AND WORK EXPERIENCE

	Place of Employment		Total Response
	North Dakota	Out of State	
The training should have:			
been about like it was in this respect	113	41	154
placed more emphasis on skill development	73	32	105
placed more emphasis on related technical knowledge	38	19	57
Total	224	92	316

TABLE 8

AREAS OF DIFFICULTY EXPERIENCED BY MDTA GRADUATES

Deficiencies	Total Response
Experienced no particular difficulty	121
Lacked necessary practical experience	76
Needed additional technical knowledge	37
Not accustomed to production standards of speed	11
Not accustomed to production standards of accuracy	5
Needed more training in how to apply for a job	5
Found it difficult to get along with other workers	2
Other	1
Total	258

Specific suggestions on how to improve the MDTA training program were listed in rank order in Table 9. The most often mentioned were suggestions for spending more time in the shops, more specific instruction and a training period of longer duration. Table 10 lists the types of additional training needed by the graduates. Additional training was needed and the MDTA graduates would most like to see evening school courses made available to them. Approximately one-third of the graduates indicated that no additional training was needed.

TABLE 9

SPECIFIC SUGGESTIONS MADE BY MDTA GRADUATES ON HOW TO IMPROVE THE MDTA TRAINING PROGRAM

Suggestions	Total Responses
More time spent in shop, lab, or on-the-job	47
More specific instruction	36
More training (longer school)	34
Better instructors and teaching methods	15
Better entrance requirements and student selection	8
Need for more modern equipment	8
Emphasis on accuracy over speed	7
Salesmanship training	6
Proceed with instruction more slowly	4
Better job placement system	3
Emphasis on speed over accuracy	3
Give college credit where applicable	1
More economy in the program	1
No specific suggestions (none needed)	77
Total	250

TABLE 10

TYPE OF ADDITIONAL TRAINING OPPORTUNITIES NEEDED

Type of Training	Response
Evening school courses	110
None needed	108
More advanced training	60
One or two week short courses	56
Total	334

Additional information, particularly on the questionnaire items not discussed in this chapter, may be found in Appendix D. Discussion and interpretation is left to the reader. Appendix D contains the results of all the questionnaire items with the exception of those which were presented and discussed in this chapter.

CHAPTER V

CONCLUSIONS AND RECOMMENDATIONS

Conclusions

The primary purpose of this study was to ascertain the effectiveness of the MDTA institutional programs in North Dakota. A mailed interview survey form was sent to each of the persons who had completed one of the MDTA programs and who had been a part of the labor market for at least one year. The results of the survey as well as personal contacts with both trainees and teachers led the authors to the following conclusions:

1. The MDTA programs were effective in getting people employed. All of the participants were unemployed at the time of their enrollment in the program. The rate of employment for those persons studied was 93.56 per cent, of which the total amount must be considered an increase in the rate of employment.

2. The reported hourly wages received by the MDTA graduates indicated that they were employed at rates above those which could be expected for untrained workers.

3. MDTA graduates employed outside the state received higher wages than those employed within the state.

4. As evidenced by 127 persons employed in occupations different than the one in which they were trained, this type of training program (designed for entry level occupations) provided the means

whereby persons were able to explore related occupations.

5. Graduates of MDTA programs typically did not want to change their place of residence in order to obtain employment.

6. A strong point which contributed greatly to the success of the program was the personal contact between the coordinator (state vocational staff member) and the trainee.

7. Persons who graduates from the MDTA programs desired additional more-advanced training.

8. Graduates employed in trade and industrial and technical occupations earned higher hourly wages than did graduates employed in other fields.

9. Graduates of MDTA programs typically did not maintain contact with their training institution once they completed their training.

10. Responses from the graduates indicated that they were well satisfied and even enthusiastic about the MDTA training programs.

Recommendations

The recommendations presented herein are a result of the knowledge gained in conducting the study and observations of the authors as well as specific findings of the study. The recommendations are:

1. MDTA institutional programs in North Dakota should be continued and expanded as an effective means of preparing persons for entry level employment.

2. Increased effort should be made in the area of selecting training programs in occupations which provide jobs with reasonable wages and exploratory experiences in geographic areas suitable to the

trainees.

3. Increased emphasis should be placed on the laboratory phases of the training programs, including both training within the school and on-the-job.

4. Personal contact between the state staff members (coordinators) and the trainees should be maintained. Funds for the support of additional staff should be provided.

5. In addition to the follow-up studies conducted by the State Employment Service, an annual evaluation of the total training program should be conducted. The results of such an evaluation should be used to effect modifications which would keep programs relevant to the needs of employers and employees.

APPENDIX A

June 22, 1967

Dear MDTA Graduate:

We are interested in what you are doing and how you are getting along with your particular job. You are in a position to give us suggestions in methods of improving our training program.

You may help us by completing the short survey form which is enclosed. We will use the information you submit to evaluate our programs of study and to aid us in counseling prospective students. Please complete this form today and return it to us promptly so your reply will become a part of the report compiled from the entire survey. The information you submit will be kept confidential. You will find a postage paid, self-addressed envelope enclosed for your convenience.

Sincerely yours,

LYLE EVENSON
MDTA Counselor

FRANK N. FISCHER
State Supervisor of Manpower

LE: cm

Enclosures

August 11, 1967

Dear MDTA Graduate:

A questionnaire dated June 22, 1967, concerning your MDTA Training, was mailed to you with a stamped, self-addressed envelope.

To date, we have received no response. We know that you appreciated the training you received through the Manpower program and that you would like to show this appreciation by mailing your response to us.

We are enclosing another copy of the questionnaire in the event that the first one was lost or misplaced. Please send it today to:

Frank N. Fischer, Supervisor of
Manpower Development & Training Program
State Capitol - Eighth Floor
Bismarck, North Dakota 58501

Thank you for your cooperation.

Sincerely yours,

LYLE EVENSON
MDTA Counselor

FRANK N. FISCHER
State Supervisor of Manpower

LE: cm

Enclosure: Questionnaire

October 18, 1967

Dear MDTA Graduate:

After two previous mailings to you in an attempt to seek important information concerning the value and benefits of the MDTA Program, we urge you to complete and return the enclosed MDTA Follow-up Study.

To help determine the worth of a program, periodic evaluations are necessary. You can be of much help in evaluating the program. This may help determine the future of MDTA Programs.

To date we have had approximately a 75% return, so won't you help raise this to 100%.

Sincerely yours,

LYLE EVENSON
MDTA Counselor

FRANK N. FISCHER
State Supervisor of Manpower

LE: cm

November 28, 1967

Dear MDTA Graduate:

Our cut off date for our MDTA Follow-Up Study is January 1, 1968.

This is our 4th mailing to you so surely you can see the importance of your part in the Follow-Up Study.

Will you please complete and return the enclosed MDTA Follow-Up Study.

Sincerely yours,

LYLE EVENSON
MDTA Counselor

FRANK N. FISCHER
State Supervisor of Manpower

MDTA FOLLOW-UP STUDY

DIRECTIONS: Please fill in the blanks below with the correct information or check the appropriate places to answer the questions as they apply to you. Do not skip any items. Write plainly or print.

1. Name _____

2. Complete mailing address _____

3. Name and address of present or last employer. (Include firm name)

   _____

   _____

4. What course did you complete during your MDTA Training? _____

   _____

5. What is the title of the job you have now? _____

6. How did you get in touch with your first job after your training? (Through the school, employment service, advertisement, personal effort, a friend or other) _____

   _____

7. If your present job is different from the trade for which you were trained, give your chief reason for changing to another occupation. (Check only one)

   ( ) Am working in same trade
   ( ) No job available in my trade
   ( ) Developed new interest
   ( ) Disliked trade for which I was trained
   ( ) Found better opportunity
   ( ) Never intended to follow trade
   ( ) This work pays better
   ( ) Other reason (Explain)

   _____

   _____

8. What do you consider to be the chief value of the shop or laboratory instruction you received in your trade training program? (Check only one)

   ( ) Not working at trade studied
   ( ) No special advantage
   ( ) It helped me to obtain employment
   ( ) It gave me a good foundation for advancing on the job
   ( ) It helped me to begin at a higher wage
   ( ) It provided a foundation for additional training
   ( ) Other (Explain) _____

   _____

   _____

9. What do you consider to be the chief value of the related technical information you received as a part of your trade training? (Check only one)
   ( ) Not working at trade studied
   ( ) No special advantage
   ( ) It helped me to obtain employment
   ( ) It helped me to understand trade terminology
   ( ) It helped me to understand the "why" of the skills and processes of the training
   ( ) It provided a foundation for additional training
   ( ) Other reason (Explain) _____

10. For what aspect of your trade or occupation did you find that you were least prepared when you started to work? (Check only one)
   ( ) Experienced no particular difficulty
   ( ) Not accustomed to production standards of speed
   ( ) Found it difficult to get along with other workers
   ( ) Not accustomed to production standards of accuracy
   ( ) Lacked necessary practical experience
   ( ) Needed additional technical knowledge
   ( ) Needed more training in how to apply for a job
   ( ) Not working at trade or occupation studied
   ( ) Other (Explain) _____

11. Looking back on your training and your experience as a worker, do you think your trade training should have: (Check only one)
   ( ) Been about like it was in this respect
   ( ) Placed more emphasis on the development of skill
   ( ) Placed more emphasis on related technical instruction

12. What specific suggestions do you have to offer for the improvement of trade school training in the trade for which you were trained?

   _____

   _____

13. What contact have you made with your training institution since you graduated. (Check as many as necessary)
   ( ) No contacts
   ( ) Was aided in securing first job
   ( ) Was advised to return for additional training
   ( ) Have visited the school shops
   ( ) Have returned for vocational advisement
   ( ) Other (Explain) _____

14. What was the chief reason influencing you to enroll in the MDTA training program? (Check only one)
   ( ) No particular influence
   ( ) Advice of family
   ( ) Advice of other students
   ( ) Advice of counselor
   ( ) High school shop experience
   ( ) Work experience in the trade
   ( ) Employment Service
   ( ) Had no prospects for attending four year college
   ( ) Lack of interest in academic subjects
   ( ) Other influence (Explain _____

15. What type of additional training should your MDTA Training institution offer in order for you to improve your skills and knowledge?
( ) None needed
( ) One or two week short courses
( ) Evening school courses
( ) Explain nature of courses desired _____

_____

16. What is your present salary? This information helps us a great deal in counseling students. Please put the figure in one of the appropriate blanks.
Hourly_____ Weekly_____ Monthly_____

Yearly_____

17. How many hours do you work per week?_____

18. Do you feel that evening courses in public speaking, human relations, bookkeeping, and other similar courses would be of benefit to students?_____

19. Which one of the above courses do you feel would be most valuable?

_____

Appendix B

Preliminary Statistical Analysis to Determine Comparability of Follow-up Groups of Questionnaires

Of the 637 questionnaires originally mailed in June 1967, 388 or 60.9 per cent were ultimately returned by January 1968, in response to mailed reminders. Each of the 388 questionnaires was then placed into one of four groups on the basis of an arbitrary cut-off date of reception in Bismarck. The first group contained 231 questionnaires, the second group 92, the third group 28, and the fourth 37.

TABLE 1

OBSERVED FREQUENCIES OF RESPONDENTS RESIDING IN NORTH DAKOTA VERSUS THOSE RESIDING IN OTHER STATES OVER FOUR MAIL GROUPINGS*

Place of Residence	Mailings 1	2	3	4	Total
North Dakota	173	63	19	17	272
Other states	58	29	9	3	99
Total	231	92	28	20	371

*Obtained chi-square value was 2.99 with 3 df which was not significant at the .05 level

To determine whether or not the data from each of the four groups was not dissimilar enough to preclude the pooling data into a single general summary, statistical tests, performed before receipt at the

Research Coordinating Unit of the final 17 questionnaires, were conducted on the information obtained from items 5, 16, and 17. The information contained in these items was considered to be of prime interest to the initiators of the project and therefore crucial to any attempt to compare the data of the groups with each other. Considering trends over the four groups, the following questions were asked. Was there a statistically significant difference: (1) in the questionnaire return rate between respondents employed in-state versus those employed out-of-state; (2) in the return rate of respondents employed in the field for which they were trained versus those employed in different fields or unemployed; (3) in the return rate of respondents who were employed versus those not employed; (4) in mean (i.e., average) hourly wages earned by respondents employed in-state versus those employed out-of-state; and (5) in mean number of hours worked per week by respondents employed in-state versus those employed out-of-state?

Specifically, the results of each of the five statistical tests were as follows. For question one, the obtained chi-square of 2.99 was significant at only the .50 probability level (df=3). For question two, the obtained chi-square was 1.00 which value is significant at only the .70 level (df=3). The obtained chi-square of 0.45 for question three was significant at only the .95 level (df=3). For question four, each respondent's reported wage was first converted into a mean (i.e., average) hourly rate. Then, within each of the four groups a grouped frequency distribution of the mean hourly wages was constructed. That is, instead of indicating individual mean wage rates, such rates were grouped into intervals of a quarter dollar; thus, $1.25 to $1.49, $1.50

49

TABLE 2

OBSERVED FREQUENCIES OF RESPONDENTS EMPLOYED IN FIELD FOR WHICH TRAINED VERSUS THOSE NOT EMPLOYED IN FIELD FOR WHICH TRAINED (INCLUDING UNEMPLOYED) OVER FOUR MAIL GROUPINGS*

Employment Field	Mailings 1	2	3	4	Total
For which trained	138	47	16	10	211
Other fields/unemployed	93	45	12	10	160
Total	231	92	28	20	371

*Obtained chi-square value was 1.00 with 3 df which was not significant at the .05 level

to $1.74, etc. in order to facilitate visual inspection of the data as well as for computational convenience. The midpoint of each interval (e.g., $1.37, $1.62) was then assigned a number from 1 to 19. For example, the number 1 was assigned to the midpoint of the category "ninety-nine cents an hour or less", the number 2 was assigned to the midpoint of the next category "$1.00 to $1.24", and so on. The number 19 was assigned to the midpoint of the category "more than $5.00 an hour." Separate distribution for respondents employed in-state and those employed out-of-state were obtained for each of the four groups. The numbers thus assigned to the midpoints of the wage categories within each of the two classifications of each of the four groups were then analyzed within a two-way analysis of variance design. The results of the F test showed first, no statistically significant difference in mean hourly wages among the four mail groups; hence, this result was more

evidence supporting a move to pool each group's data. Secondly, there was a significant difference in mean hourly wages paid to respondents employed out-of-state as compared to those employed in-state.

TABLE 3

OBSERVED FREQUENCIES OF RESPONDENTS EMPLOYED VERSUS THOSE UNEMPLOYED OVER FOUR MAIL GROUPINGS*

Employment Status	Mailings 1	2	3	4	Total
Employed	205	82	26	18	331
Unemployed	26	10	2	2	40
Total	231	92	28	20	371

*Obtained chi-square value was 0.45 with 3 df which was not significant at the .05 level

TABLE 4

SUMMARY OF ANALYSIS OF VARIANCE OF MEAN HOURLY WAGES OF RESPONDENTS EMPLOYED IN NORTH DAKOTA VERSUS THOSE EMPLOYED OUT-OF-STATE OVER FOUR MAILINGS

Source	df	ss	ms	F	P
In/Out-of-state	1	280.76	280.76	40.05	<.01
Mailings	3	17.00	5.67	<1.00	NS
Interaction	3	76.71	25.57	3.65	<.05
Error	306	2,143.68	7.01		

It can be seen that within all four mail groupings, respondents employed out-of-state receive consistently higher mean hourly wages than do those employed in-state. This finding supports empirically the generally held notion that wage rates are higher outside the state. This significant finding, however, does not preclude the collapsing of data across all four groups. Finally, the unexpected significant interaction between mail groupings and place of employment appeared to be largely a result of the responses returned in the second mail group by those employed out-of-state. This significant result may be attributed to the fact that the cut-off dates of receipt of the questionnaires marking the basis for distinction between the four groups were arbitrarily set. This result merely reflected a chance inclusion of out-of-state respondents who took longer in replying and thus missed being included in the first mail grouping. In any event, this significant interaction did not prevent the pooling of data.

TABLE 5

SUMMARY OF ANALYSIS OF VARIANCE OF MEAN NUMBER OF HOURS WORKED PER WEEK BY RESPONDENTS EMPLOYED IN NORTH DAKOTA VERSUS THOSE EMPLOYED OUT-OF-STATE OVER FOUR MAILINGS

Source	df	ss	ms	F	P
In/Out-of-state	1	1.69	1.69	<1.00	NS
Mailings	3	12.62	4.21	1.37	<.25
Interaction	3	2.00	0.67	<1.00	NS
Error	307	943.45	3.07		

To answer the question concerning the mean number of hours worked per week, the same general routine was followed as was used in answering question four. Thus, reported work time was converted into a mean weekly rate, and then grouped into intervals of five hours; thus, 10 to 14, 15 to 20, etc. The midpoints of each category (e.g., 12, 17) were then assigned a number from 1 to 14. The number thus assigned to the midpoints of the hour categories within each of the two classifications of each of the four mail groups were then analyzed within a two-way analysis of variance design. The results of the F tests are given in Table 5.

It can be seen that there were neither significant main effects nor a significant interaction, thus, here was further evidence indicating that pooling data from all four groups was allowable.

APPENDIX C

Statistical Analyses of Non-Responders

1. Chi-square test on number of responders and non-responders employed in or outside of North Dakota. Figures represent observed frequencies.

	Responders	Non-Responders	Total
In state	282	18	300
Out-of-state	106	16	122
Total	388	34	422

χ^2=5.01, df=1, significant at .05 level

2. Chi-square test on number of responders and non-responders either employed or not employed in field for which trained. Figures represent observed frequencies.

87TH CONGRESS, 1st Session } HOUSE OF REPRESENTATIVES { DOCUMENT No. 92

AMERICAN EDUCATION

MESSAGE

FROM

THE PRESIDENT OF THE UNITED STATES

RELATIVE TO

AMERICAN EDUCATION

FEBRUARY 20, 1961.—

To the Congress of

Our progress as
education. Our re
nomic growth, and
this all require the
capacity.

The human min
eral program must
and equipment. I
vest in human bein
in their more adv
such measures, th
responsibilities for
strength.

Our progress in
stantial. We are
higher degree of e
fourth of our total
This year $26 billion will be spent on education alone.

But the needs of the next generation—the needs of the next decade and the next school year—will not be met at this level of effort. More effort will be required—on the part of students, teachers, schools,

IV. VOCATIONAL EDUCATION

The National Vocational Education Acts, first enacted by the Congress in 1917 and subsequently amended, have provided a program of training for industry, agriculture, and other occupational areas. The basic purpose of our vocational education effort is sound and sufficiently broad to provide a basis for meeting future needs. However, the technological changes which have occurred in all occupations call for a review and re-evaluation of these acts, with a view toward their modernization.

To that end, *I am requesting the Secretary of Health, Education, and Welfare to convene an advisory body drawn from the educational profession, labor-industry, and agriculture, as well as the lay public, together with representation from the Departments of Agriculture and Labor, to be charged with the responsibility of reviewing and evaluating the current National Vocational Education Acts, and making recommendations for improving and redirecting the program.*

BY 1970, EIGHTY-SEVEN MILLION WILL BE WORKING FULL-TIME

NOW AT WORK WILL STILL BE EMPLOYED . . .

They need training to keep pace with new methods, new materials, new opportunities.

YOUNG WORKERS WILL START WORK, 1960–1970 . . .

Their aptitudes, skills and education must match the needs of a changing economy.

WOMEN WILL SWITCH FROM HOUSE-WORK TO JOBS, 1960–1970

These wives, mothers and widows will also need marketable skills in the decade ahead.

Education makes people more productive and versatile
Productive, versatile people will build
a stronger and better America . . .

SCHOOLS MUST HELP 26 MILLION YOUNGSTERS WORK THEIR WAY THROUGH THE CHALLENGING DECADE AHEAD .....

OF EVERY TEN YOUNGSTERS NOW IN GRADE SCHOOLS

Three will not finish high school

Seven will earn a high school diploma

Three will go to work, some as wives and mothers

Four will continue their education

EIGHT OUT OF TEN WILL NOT COMPLETE COLLEGE .....

. . . even though college enrollments will double!

Only two will finish four years of college

HOW WILL THEY FARE IN THE CHANGING WORLD OF WORK

1960-70...

THE MOST RAPIDLY EXPANDING OCCUPATIONS REQUIRE THE MOST EDUCATION AND TRAINING

HOW PEOPLE PREPARE FOR WORK IN THE U.S. TODAY

Occupational competence is attained in many ways

On-the-job training, either informal or in educational programs organized by employers.

Apprenticeship, journeymen training and other education programs sponsored by trade unions.

Private technical institutes, trade and business schools (including correspondence courses).

Armed services give excellent training, but only in a limited number of civilian occupations.

State and Federal Government programs—Department of Agriculture, etc.

National public program of Vocational and Technical Education

Local-State-Federal programs of public vocational education and technical training.

Current Enrollment	
Distributive Occupations	306,083
Homemaking	1,610,334
Agriculture	805,322
Practical Nursing	47,264
Trades and Industry	963,609
Technician Training	122,952

SINCE 1917, THE FEDERAL GOVERNMENT HAS HELPED OUR PUBLIC SCHOOLS PREPARE PEOPLE FOR JOBS

Congress reviews the local-State-Federal vocational education program each year, as it appropriates the Federal funds to match local and State expenditures. In addition, the program has been expanded and extended by several successive enactments. The major vocational education statutes are:

S. 703.

A BILL

To provide for the promotion of vocational education; to provide for cooperation with the States in the promotion of such education in agriculture and the trades and industries; to provide for cooperation with the States in the preparation of teachers of vocational subjects; and to appropriate money and regulate its expenditure.

By Mr. Smith of Georgia.

Smith-Hughes Act, 1917
$7 million per year

S. 3958

A BILL

To improve the health of the people by assuring the increasing the number of adequately trained professional and practical nurses and professional public health personnel by assisting in the development of improved methods of care and treatment of mental health, and for other purposes.

By Mr. Hill, Mr. Aiken, Mr. Bible, Mr. Bush, Mr. Long, Mr. [illegible]

Practical Nurse Amendment 1956
$5 million per year

S. 987

A BILL

To authorize the retraining of persons displaced from their jobs by automation or other technological developments, foreign competition, relocation of industry, shift in market demands, or other changes in structure of the economy.

By Mr. Clark, Mr. Humphrey, Mr. [illegible], Mr. Harris of Mass.

Manpower Development & Training Act, 1962
$20 million for job training in 1962

S. 2379

A BILL

To promote the fishing industry in the United States and its Territories by providing for the training of needed personnel for such industry.

By Mr. Pastore, Mr. Bible, Mr. Brewster, Mr. [illegible], Mr. Carlson, Mr. Dworshak, Mr. Fulbright, Mr. Gruening, Mr. Hartke, Mr. Hayden, Mr. Hickey, Mr. Hickenlooper, Mr. Fong, Mr. Proxmire, Mr. [illegible], Mr. [illegible]

Fishery Training Amendment 1956
$180,000 per year

S. 1

A BILL

To establish an effective program to alleviate conditions of substantial and persistent unemployment and underemployment in certain economically distressed areas.

By Mr. Douglas, Mr. Clark, Mr. Case, Mr. Eastland, Mr. Byrd of West Virginia, Mr. Randolph, Mr. Byrd of Virginia, Mr. Williams of New Jersey, Mr. Brewster, Mr. Dodd, Mr. Jordan, Mr. Hartke, Mr. Hickey, Mr. Fulbright, Mr. Bennett, Mr. Hickenlooper, Mr. Aiken, Mr. Bush, Mr. Carlson, Mr. Dworshak, Mr. Fong, Mr. Hruska, Mr. Kuchel, Mr. Miller, Mr. Morton, Mr. Prouty, Mr. Scott, Mr. Thurmond, Mr. Wiley, Mr. Young of North Dakota, Mr. Bible, Mr. Carroll, Mr. Dodd, Mr. Hartke, Mr. Hickey, Mr. Hill, Mr. Long, Mr. Mansfield, Mr. McCarthy, Mr. McGee, Mr. McNamara, Mr. Monroney, Mr. Moss, Mr. Muskie, Mr. Pastore, Mr. Proxmire, Mr. Smith, Mr. Symington, Mr. Yarborough, Mr. Young of Ohio

Area Redevelopment Act, 1961
$3 million for training in 1962

H. R. 4384

A BILL

To amend the Act of June 8, 1936, relating to vocational education, so as to provide for the further development of vocational education in the several States and Territories.

By Mr. Barden

George-Barden Act, 1946
$29 million per year

H. R. 13247

A BILL

To strengthen the national defense and to encourage and assist in the expansion and improvement of educational programs to meet critical national needs; and for other purposes.

By Mr. Barden

National Defense Education Act, 1958
$15 million per year for technician training

This summary of current Federal statutes does not include the laws authorizing special vocational education programs which trained 7.5 million people during World War II at a 5-year cost of $297 million.

TODAY THESE LAWS . . .

- **Benefit 4 million students (half are adults)**
- **In 2/3 of our high schools and many colleges**
- **A $250 million Local-State-Federal program**

Every State and Territory offers federally aided vocational education programs. Each State has a vocational education board to set policy. Federal funds can be used for classroom or shop equipment, but not for buildings; nearly all the Federal funds are used by the States as partial reimbursement for teachers' salaries. In all but the most recent programs, States must match Federal funds, dollar-for-dollar. In general, State and local expenditures far exceed the matching requirements. The types of reimbursable vocational instruction are specified by Federal law, as well as the age and job status of the students.

Vocational Education Enrollments

Investment in Vocational Education From Local, State, and Federal Sources

Panel At Work

Panel to Study Vocational Education

Twenty-five representative citizens—chosen by the Secretary of Health, Education, and Welfare—worked for more than a year analyzing the implications for vocational education of automation, technological advance, population mobility, discrimination, urbanization, as well as the strengths and limitations of the present local-State-Federal programs.

LOCAL-STATE-FEDERAL PARTNERSHIP TEACHES SKILLS THE NATION NEEDS

THE PANEL REPORTS . . .

. . . VOCATIONAL EDUCATION IS NOT AVAILABLE IN ENOUGH SCHOOLS

Survey Included Only Federally Reimbursed Vocational Courses in Alabama, Georgia, Iowa, Nebraska, Ohio, and Pennsylvania

Opportunity for Vocational Education Varies With Size of Community

SCHOOLS OFFERING . . .	Under 2,500 Population	2,500–30,000 Population	Over 30,000 Population
TRADE & INDUSTRIAL COURSES	2%	14%	31%
HOME-MAKING COURSES	42%	56%	39%
AGRICULTURE COURSES	49%	50%	16%
DISTRIBUTIVE COURSES	0%	5%	27%

The Area School

Vocational education is specialized education and often relatively expensive to provide. For these reasons, neighboring school districts sometimes join forces to support an "area school" open to all their qualified students. In this way even small school districts can offer diversified vocational or technical education of high quality.

THE PANEL REPORTS . . .

. . . VOCATIONAL EDUCATION IS NOT AVAILABLE TO ALL WHO NEED IT

Even in the largest cities, vocational education enrolls less than one-fifth of the high school students

In Baltimore, Boston, Buffalo, Chicago, Cleveland, Detroit, Houston, Los Angeles, Milwaukee, New York, Philadelphia, Pittsburgh, St. Louis, and Washington, 1961–62 enrollments totaled 637,923 in Grades 10–12. Of this total, only 18% (115,575) was in federally reimbursed vocational courses.

THE PANEL REPORTS . . .

. . . VOCATIONAL EDUCATION IS NOT PREPARING FOR ENOUGH JOBS

Few Workers Prepare For Their Jobs Through Vocational Education Courses

Enrollment of boys in 1955 compared with jobs men held 6 years later

Ratio of	1955 enrollment	to	1961 employment
AGRICULTURE	10	→	100
DISTRIBUTIVE EDUCATION	1	→	200
TRADES AND INDUSTRIES	2	→	444

Availability of Certain High School Vocational Courses Partially Financed With Federal Funds, 1961–62

THE PANEL REPORTS . . .

. . . AND TECHNICAL TRAINING AFTER HIGH SCHOOL IS A CRITICAL NEED

Estimated growth in technician jobs, 1960-70

Sound estimates range from 67,800 to 200,000 new technicians needed each year, 1960-1970.

Technicians are being trained in many ways

To make people more productive and versatile . . . to build a stronger and better America, the President's Panel of Consultants on Vocational Education presents this . . .

AGENDA FOR ACTION

Agenda for Action

IN A CHANGING WORLD OF WORK, VOCATIONAL EDUCATION MUST . . .

- **Offer training opportunities to the 21 million non-college graduates who will enter the labor market in the 1960's.**
- **Provide training or retraining for the millions of workers whose skills and technical knowledge must be updated, as well as those whose jobs will disappear due to automation or economic change.**
- **Meet the critical need for highly skilled craftsmen and technicians through education and training beyond the high school.**
- **Expand vocational and technical training programs consistent with employment possibilities and national economic needs.**
- **Make education and training opportunities equally available to all, regardless of race, sex, or place of residence.**

VOCATIONAL AND TECHNICAL EDUCATION
A LOCAL-STATE-FEDERAL PARTNERSHIP

The Federal Government must continue to work with States and local communities to develop and improve the skills of our citizens.

The Local-State-Federal partnership must increase its support of vocational or technical education for . . .

HIGH SCHOOL YOUTH

I **Youth in high school who are preparing to enter the labor market or to become homemakers.**

YOUTH WITH SPECIAL NEEDS

II **High school youth with academic, socio-economic or other handicaps that prevent them from succeeding in the regular vocational education program.**

POST-HIGH SCHOOL YOUTH

III **Youth and adults who have completed or left high school and are full-time students, preparing to enter the labor market.**

WORKING YOUTH AND ADULTS

IV **Youth and adults unemployed or at work who need training or retraining to achieve employment stability.**

. . . AS WELL AS

V **Services and facilities required to assure quality in all vocational and technical education programs.**

Agenda for Action

OCCUPATIONAL PREPARATION IS A TASK OF EVERY AMERICAN HIGH SCHOOL

The world of work requires many more young people well trained to enter employment in agriculture, the skilled trades, business, industry, merchandising, service occupations, and the technical and health fields, as well as homemaking. Since our population is highly mobile, responsibility for occupational preparation must be shared by every high school, but vocational and technical education is especially important in our urban centers, which offer the most employment opportunities.

I For Youth in High School Who Are Preparing To Enter The Labor Market Or To Become Homemakers

Present vocational education programs should expand . . .

TRAINING FOR OFFICE OCCUPATIONS should be included among federally reimbursed vocational education programs.

PRE-EMPLOYMENT TRAINING FOR THE DISTRIBUTIVE OCCUPATIONS should be eligible for Federal support as well as the present cooperative work-school programs.

THE VOCATIONAL AGRICULTURE PROGRAM, under Federal reimbursement, should be broadened to include instruction and increased emphasis on management, finance, farm mechanization, conservation, forestry, transportation, processing, marketing the products of the farm and other similar topics.

II For High School Youth With Academic, Socio-Economic Or Other Handicaps That Prevent Them From Succeeding In the Regular Vocational Education Program.

INSTRUCTION should be highly individualized to meet the unique needs of these students for employment. Specially qualified and highly motivated teachers with occupational competence, who understand the needs of disadvantaged youth, should be employed for this purpose.

OCCUPATIONAL INFORMATION of practical significance and expert vocational counseling must be made available to these youth.

DIVERSITY AND FLEXIBILITY must characterize these programs. Experimental or pilot projects should be fully supported by Federal funds to develop effective instruction.

Agenda for Action

III FOR YOUTH AND ADULTS WHO HAVE COMPLETED OR LEFT HIGH SCHOOL AND ARE FULL-TIME STUDENTS, PREPARING TO ENTER THE LABOR MARKET

OUR ADVANCING TECHNOLOGY demands more skilled craftsmen and highly skilled technicians in occupations requiring scientific knowledge. Vocational and technical education must prepare many more technicians and skilled craftsmen for employment in industry, business, agriculture and the health fields.

THE AREA VOCATIONAL SCHOOL and the specialized vocational school in large urban centers both provide a diversity of occupational training programs to large numbers without the usual restrictive residence requirement. Many more of these schools are needed, especially for training highly skilled craftsmen and technicians.

TECHNICIAN TRAINING is also available in community or junior colleges, agricultural and technical institutes, and vocational-technical schools. To expand their output—a national need of urgent importance—the Federal Government must increase its support of full-time, post-high school vocational and technical training.

Agenda for Action

IV FOR YOUTH AND ADULTS UNEMPLOYED OR AT WORK WHO NEED TRAINING OR RETRAINING TO ACHIEVE EMPLOYMENT STABILITY

TRAINING COURSES MUST BE EXPANDED for the millions of workers who require updating and upgrading—lifelong learning—in an era of changing materials, processes, tools, and techniques.

COURSES IN MANY MORE OCCUPATIONS, including the office and service occupations, should be made available to these workers.

MORE EQUIPMENT AND FACILITIES must be provided to extend these opportunities to many more workers, especially those living in communities where training is a critical need.

APPRENTICE AND JOURNEYMEN training opportunities should be expanded by mutual action of employers and unions.

Agenda for Action

V SERVICES AND FACILITIES REQUIRED TO ASSURE QUALITY IN ALL VOCATIONAL AND TECHNICAL EDUCATION PROGRAMS

TEACHER AND LEADERSHIP TRAINING PROGRAMS must be improved and enlarged. Higher educational institutions, especially land-grant colleges and State universities, should provide for the professional growth of vocational and technical teachers.

INSTRUCTIONAL MATERIALS of high quality must be available for all programs. To promote their development, instructional materials laboratories should be established in appropriate institutions. These laboratories should be financed and coordinated through the U.S. Office of Education, Division of Vocational and Technical Education.

OCCUPATIONAL INFORMATION AND GUIDANCE SERVICES must be available for all students. State and national leadership for these programs should be supported and coordinated by the U.S. Office of Education, Division of Vocational and Technical Education.

RESEARCH AND DEVELOPMENT in vocational and technical education should be encouraged, supported and coordinated at the national level. The results of this research and development should be made available on a nationwide basis.

BY 1970, EIGHTY-SEVEN MILLION

Financing Vocational And Technical Education

Support from all sources must expand as enrollments grow, as potential dropouts remain in school, and as adult training and retraining become more general. Local and State governments should increase the half billion dollars they now provide annually for operation, administration, and construction.

The Federal Government should provide at least $400 million in 1963–64 as its investment in the millions of youth and adults who can benefit immediately from vocational and technical education. (This amount would include the $55–$75 million to be expended in the current year.) Future Federal expenditures should be increased as justified by the need for trained manpower. The proposed 1963–64 Federal appropriation should include:

		1963–64 School Year
I	For youth in high school who are preparing to enter the labor market or to become homemakers.	$ 200 *million*
II	For high school youth with academic, socio-economic or other handicaps that prevent them from succeeding in the regular vocational education program.	10 *million*
III	For youth and adults who have completed or left high school and are full-time students, preparing to enter the labor market.	50 *million*
IV	For youth and adults unemployed or at work who need training or retraining to achieve employment stability.	100 *million*
V	For services and facilities required to assure quality in all vocational and technical education programs.	40 *million*

AMERICANS WILL BE WORKING FULL-TIME

58 MILLION NOW AT WORK WILL STILL BE EMPLOYED . . .

They need training to keep pace with new methods, new materials, new opportunities. Many will require retraining as their jobs disappear due to automation and economic change. Vocational and technical education provide training and retraining.

26 MILLION YOUNG WORKERS WILL START WORK, 1960-1970

Their aptitudes, skills and education must match the needs of a changing economy. The eight out of ten who will not complete college must gain occupational competence in other ways. Vocational and technical education prepare youth for employment.

3 MILLION WOMEN WILL SWITCH FROM HOUSEWORK TO JOBS, 1960-1970

These wives, mothers and widows will also need marketable skills in the decade ahead. Vocational and technical education brush up old skills and teach new ones needed in the world of work.

Love, Gene M.

State Master Plan of Inservice Education for Vocational Agriculture Teachers. Teacher Education Series, Vol. 4, No. 7.

Pennsylvania State Univ., University Park. Dept. of Agricultural Education

MF AVAILABLE IN VT-ERIC SET.

Pub Date - 63 9p.

*AGRICULTURAL EDUCATION; *STATE PROGRAMS; *INSERVICE TEACHER EDUCATION; *INSERVICE COURSES; MASTER PLANS; VOCATIONAL AGRICULTURE TEACHERS

PENNSYLVANIA

Higher certification standards for vocational agriculture teachers have resulted in increased needs for inservice teacher education. Because of the increased needs, and the shortcomings of the present system, it was imperative to develop a state master plan for inservice teacher education. The advantages of the plan are: (1) It provides a wider selection of technical agriculture and professional courses on a regular basis and within driving distance of every teacher in the state, (2) It allows teachers to project their inservice graduate study programs 3 years into the future, (3) It facilitates improved instruction and better course continuity, (4) It reduces the time interval between classes to coincide with registration and grade reporting periods at the university, and (5) It eliminates conflicts during the summer term between on- and off-campus courses offered by the Department of Agricultural Education. A schedule of courses offered in Pennsylvania from 1963 to 1966, presented in graphic form, specifies the location, subject areas, dates, and instructors. (JM)

STATE MASTER PLAN OF INSERVICE EDUCATION FOR VOCATIONAL AGRICULTURE TEACHERS

Importance of Inservice Education

Inservice education has been defined as "a continuous process of professional research carried on simultaneously with teaching"[1] and "all the efforts by administrative and supervisory officials to promote by appropriate means the professional growth and development of educational workers."[2] Graduates of teacher education institutions after October 1, 1963, must earn twenty-four additional credits following graduation for permanent certification. This fact reflects the importance educators are placing on inservice education. For all practical purposes teacher preparation programs now require five years of study.

In view of these facts, it becomes obvious that more and more teachers will be earning advanced degrees. This being the case, colleges and universities must find better ways of meeting the inservice education needs of all teachers. Even though vocational agriculture teachers in previous years have done a commendable job of up-grading themselves in-service (33 per cent have Master's Degrees) there has never been a carefully prepared state master plan of inservice education for vocational agriculture teachers. Recent reductions in the inservice teacher education staff and the anticipated future needs of teachers now make such a plan imperative. In the years ahead, teachers of vocational agriculture will need to plan their graduate programs several years in advance.

Shortcomings of Present Systems

In the past the inservice education courses offered for teachers by the Department of Agricultural Education have been on a "first come, first served" basis. Since the number of staff members available in the Department to perform this "service" has always been inadequate, some teachers in certain areas of the state have always been neglected. A state master plan for inservice education will aleviate this injustice.

Also, the need for professional courses in agricultural education, dealing with supervision, statistics, adult education, etc., among teachers in the field has never been fully met. A state master plan for inservice education will make such courses possible and on a regular basis at convenient locations around the state. These offerings will be in addition to the technical agriculture courses which the department has traditionally offered.

Perhaps the most serious shortcoming of the present system of providing inservice education is the restrictions placed on the program by virtue of the fact that professional education efforts have been linked closely to monthly area teachers' meetings. Although adequate supervision is essential to and an integral part of good inservice instruction, the conflicts which arise when teachers meet for two entirely different purposes in a limited amount of time need to be considered.

---

[1] Bulletin of the National Association of Secondary School Principals, May 1961

[2] Dictionary of Education, Second edition, McGraw-Hill Book Co., Inc., 1959

Small classes (less than 12), the lack of continuity apparently inherent to a monthly sequence of scheduling classes and the difficulties encountered at the university in securing approval for and enrolling students and filing grades for students in courses which span two or more terms are three important reasons why a better system needs to be developed. Again, a state master plan of inservice education will do much to correct these deficiencies.

Another handicap of the present system of providing inservice education courses is the use made of several different instructors in the same course who are not familiar with the problems of teachers. For the most part, university technical specialists have been used for teaching these classes. This system of providing instruction has proved faulty largely because of the problems involved in coordinating the teaching activities of several instructors. Under the circumstances, it is difficult to achieve satisfactory continuity. A state master plan of inservice education would solve this problem.

Recent Efforts to Improve the System

More recently the Department of Agricultural Education has experimented with the use of several different methods of scheduling classes and several methods of providing instruction. Although this research is not yet completed, current data suggests (1) that classes should be scheduled no further than one (maybe two weeks) week apart and (2) instruction should be given by someone very familiar with the problems of teachers.

One Alternative Available

Recognizing the problems suggested by the facts presented above and the evidence available, the Department of Agricultural Education has only one alternative and that is to adopt a State Master Plan of Inservice Education for Vocational Agriculture Teachers. The advantages of this plan are:

1. It provides a wider selection of technical agriculture and professional courses on a regular basis and within driving distance of every teacher in the state.

2. It allows teachers to project their inservice graduate study programs three years into the future.

3. It facilitates improved instruction and better course continuity.

4. It reduced the time interval between classes to coincide with the registration and grade reporting periods (Terms) at the university.

5. It eliminates conflicts during the Summer Term between on-campus and off-campus courses offered by the Department of Agricultural Education.

The state master plan does not greatly alter the very fine inservice programs of which many teachers have previously been a part in many supervisory

areas. Teachers will recognize the inservice "centers" selected. In most cases, they are the same ones presently being used. Perhaps it should be noted here that, although centers will be used to enroll students during the first class, the site of subsequent classes may be changed to accomodate the needs of those enrolled and the requirements of the instruction given.

The plan will encourage teachers to take advantage of on-campus courses during the six-week period of the Summer Term when Ag. Ed. courses are scheduled. No conflicting off-campus credit courses will be planned by the department after the Summer Term of 1963. The selection of class meeting dates will be made yearly. Supervisors and teachers will need to help the department by giving inservice class dates a high priority rating when scheduling meetings. It should be noted that the desires of the majority of those expected to enroll have been taken into consideration in the selection of class dates for the 1963-64 school year.

State Master Plan of Inservice Education

On the following pages are a schedule of inservice teacher education credit courses to be offered in the state by the Department of Agricultural Education from the Summer Term of 1963 to the Summer Term of 1966 and a graphic picture of the location of inservice centers in the state.

SCHEDULE OF INSERVICE TEACHER EDUCATION CREDIT COURSES* TO BE OFFERED BY THE DEPARTMENT OF AGRICULTURAL EDUCATION FROM JUNE 1963 TO JUNE 1966

What Are the Facts About Half-Day Vocational Programs?

Saint Louis County Special School District, Rock Hill, Mo.
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 6Apr67 23p.

*VOCATIONAL HIGH SCHOOLS; PUBLIC OPINION; *PROGRAM LENGTH; *HIGH SCHOOLS; *TRADE AND INDUSTRIAL EDUCATION; SCHOOL SURVEYS; VOCATIONAL SURVEYS; PUBLIC RELATIONS
SAINT LOUIS COUNTY; MISSOURI

The purpose of this document is to answer public criticism of the District's Board of Education policy to operate a full-day, Type A vocational program by reviewing the reasons for the policy, examining the documents quoted and statements made in the criticisms, and reporting on the types of programs being operated in the other vocational-technical high schools of the United States. Reasons for the policy concerned attendance problems caused by difference in schedules of cooperating schools and a high dropout rate caused by student inability to meet graduation requirements of the home school when enrolled in the 2-year half-day program. Certain public statements were rebutted by presentation of original statements and complete instead of incomplete statistics. Questionnaires were sent to 367 public high schools listed as "vocational" or "technical" or those offering five or more trade and industry programs to determine the types of programs being offered. Replies received from 293 (79.83 percent) indicated that (1) 167 operate Type A programs requiring more than a half-day, and (2) of 126 which operated Type B programs requiring only 180 minutes, 98 operate on a full-day attendance basis and 28 on a half-day basis. Conclusions were: (1) The Special School District's planned program complies with the Missouri State Plan, (2) The half-day Type B program has not been fully effective, (3) The President's Panel did not recommend the half-day program, and (4) Of the schools returning questionnaires, 90.44 percent operate on a full-day basis. Replies to the questionnaires are included. (MM)

VOCATIONAL-TECHNICAL STAFF BULLETIN

April 6, 1967

WHAT ARE THE FACTS ABOUT HALF-DAY VOCATIONAL PROGRAMS?

INTRODUCTION

Recurring public criticisms of the adopted policy of the Board of Education of the Special School District of St. Louis County to operate a full-day, Type A vocational program make it seem appropriate to review the reasons for this policy; examine the documents quoted and statements made in the public criticisms; and research and report on the types of programs being operated in the other vocational-technical high schools of the United States.

REASONS FOR THE "FULL-DAY" PROGRAM

It should be first noted that the State Plan for Vocational Education authorizes the Type A program which is defined as:

> "Regular day trade classes for persons enrolled in full time school in which the related instruction is offered as units separate from the field, laboratory, shop, cooperative work or other occupational experience."[1]

When the Cooperating School Districts of the St. Louis Suburban Area requested the Board of Education of the Special School District to accept the responsibility for the administration of vocational education in the County, the principal condition stated by the Board was that if the responsibility was to be accepted the schools must operate on a "full-day" basis. The reasons were that none of the 25 separate districts operate on the same calendar; begin and end the year on widely different dates; have different daily time schedules; and eliminate classes on different days for semi-annual examinations. During the week of January 16, our daily absences for home school examinations were 31, 31, 35, 34 and 75; all different students. Further, this year there were only 151 days on which all 27 high schools in the County were in session. These two facts support the validity of the reasoning on which the Board of Education agreed to accept the responsibility only if the schools would be operated on a full-day basis.

---

1. Missouri, State Department of Education, State Plan for Vocational Education, 1964, Section 8.43-11, p 35.

VT 02653

An unanticipated but very important reason to operate on a full-day basis was revealed by a study made in September, 1966 by Mr. Alfred Weissman, Director of Vocational Pupil Personnel for the Special School District. An examination of the permanent records of individuals enrolled during the past five years in presumably two-year trade programs at the St. Louis County Technical School showed that only 11% had actually received two years of training. Inquiry indicated that the principal reason for withdrawal before completion of the course or for delaying entry until the senior year was that the graduation requirements of the home school could seldom be met by students enrolled for two years in the half-day program.

REBUTTAL OF CERTAIN PUBLIC STATEMENTS

It has been publicly stated on several occasions that Dr. Swanson "recommended that the Special School District operate on a half-day program." The publication A Gateway to Higher Economic Levels[2] in a section of the report on St. Louis County states only that "careful consideration should be given to the possibility of a one-half day program . . . . since a full-day program has in many cities become a dumping ground." That this school will not be a dumping ground is indicated by the fact that, to date, 515 parent approved applications have been received of which 450 met the entrance requirements and 370 were above the 50%ile on the 10 criteria upon which a success prediction is made.

When copies of the Governor's Study were distributed, Dr. Denis J. Kigin, Associate Director of the Study, requested the Special School District's reaction to the Study. An analysis of the document was prepared as requested. One point made in the analysis was "that 'careful consideration' was given . . . . but that others had taken the report to mean that the Study recommended that St. Louis County operate a one-half day program." Dr. Kigin's reply[3] stated:

> "Specific mention of the half-day or full-day program was not made in the recommendations (Governor's Study) and it was my observation that the Vocational Education Act of 1963 did not distinguish between types of programs but set other criteria."

It has been publicly stated on a major local television program that only 7% of all vocational students in the United States are enrolled in "full-day" programs but in making that statement no indication was given that 90.2% of the national vocational enrollment is in Agriculture, Business, Distributive, Home Economics and Health Occupations, none of which generally operate more than two periods daily and most of which are 4-year programs.

---

2. J. Chester Swanson, A Gateway to Higher Economic Levels, a study of vocational technical education to serve Missouri, School of Education, University of California (Berkeley, 1966) pp 41-42.
3. Letter from Dr. Denis J. Kigin, Associate Professor, Industrial Education, University of Missouri, February 16, 1967 (in files of W. K. Dunton).

The 1965 high school national enrollments[4] in these fields were:

Agriculture	516,893	18.3%
Business	498,034	17.7%
Distributive	76,186	2.7%
Health Occupations	8,744	.3%
Home Economics	1,442,807	51.2%
Trade and Industrial	276,586	9.8%
	2,819,250	100.0%

Thus, if the quoted 7% figure is correct, 70.4% (7% ÷ 9.8%) who could have been enrolled in a program longer than a half-day were enrolled in the longer program.

It has been publicly stated that "the President's Panel on Vocational Education recommended the half-day program." A careful examination of the 296 pages of the Report reveals no such recommendation and Dr. George Brandon, Deputy Director of the Administrative Staff for the Panel has written "I do not recall that the Panel of Consultants spent any time to any extent discussing the various merits of Type A or Type B."[5]

It has been publicly stated that "there is no other program in America like the one being proposed in St. Louis County." Because of the probable large number of people viewing the television program on which this statement was made a letter was written Walter Arnold, Assistant Commissioner for Vocational and Technical Education in the Office of Education, Department of Health, Education and Welfare to inquire regarding the number of students enrolled in Type A and Type B Trade and Industrial Education Programs. Mr. Arnold replied that "these figures are no longer included in the annual reports" but added that "Type A programs have been in existence and have operated successfully in a number of states."[6]

Because the Federal reports no longer provide the requested information, it was decided that a survey of all vocational and technical high schools in the United States should be made to determine how many operate Type A programs, all of which require more than a half-day, and how many of those operating Type B programs operate on a full-day basis.

Reply postal cards were sent to 367 public high schools listed as "vocational" or "technical" and those offering five or more T & I programs in the most recent Directory.[7] Replies were received from 293 schools (79.83%). A tabulation of the replies[8] provided the following data:

---

5. Letter from Dr. George L. Brandon, Head, Department of Vocational Education, Pennsylvania State University, University Park, Pennsylvania, February 10, 1967 (in files of W. K. Dunton).
6. Letter from Walter Arnold, Washington, D. C., January 13, 1967 (in files of W. K. Dunton).
7. U. S. Department of Health, Education and Welfare, Office of Education, Preparatory Trade and Industrial Training Programs in Public Schools, A directory, Bulletin 1963, No. 4, pp 272.
8. Reply cards available (in files of W. K. Dunton).

167 Schools operate Type A requiring more than a half day
- 28 More than 180 minutes shop and 2 periods related
- 94 180 minutes shop and 2 periods related
- 45 180 minutes shop and 1 period related

126 Schools operate Type B requiring only 180 minutes
- 98 operate on a full-day attendance basis
- 28 operate on a half-day attendance basis

From the above data, it may be observed that of the 293 listed schools that replied 265 (90.44%) operate on a full day basis even though 98 of them offer only a Type B program. Only 28 operate on a half-day basis. The Appendix to this report details this information by states and by individual schools.

CONCLUSION

It may be concluded from the above documented data and information that the Special School District's planned program complies with the Missouri State Plan; that the half-day Type B program formerly operated here has not been fully effective; that the President's Panel did not recommend the half-day program; and that 90.44% of the vocational high schools in the United States operate on a full-day basis. It thus appears that many of the quoted statements were made by persons to whom all the facts regarding vocational programs had not been made available.

The statement has also been made on another prominent local television program that "they want to make it a Harvard." If, by this, the critic meant "the best" for the youth of St. Louis County he is right. The Board of Education of the Special School District has the avowed aim of making this the finest program of vocational education in America.

BUCKS COUNTY, PENNSYLVANIA

The purpose of the study was to determine the present and future needs for post-high school education, the ability of existing facilities to meet the needs, factors which restrict educational opportunities, and courses of action for meeting local educational needs. The objectives of Phase I were to develop a series of detailed research questions, identify data resources, determine data collection methods and methods of estimating specific programs needs in a geographic area, and develop a detailed work program. An advisory council representing education, business, labor, and government were to be deeply involved in the decision processes. Required data were to be obtained from (1) a survey of large employers in the area, (2) a survey of high school seniors, (3) a study of school records data, and (4) a survey of Bucks County Adults. The detailed work schedule, plans for data collection including budget information and time estimates, and plans for the Phase II analysis and Phase III council decisions are included. The appendixes list results of Phase I activities; revised research question, data collection methods, a list of study resources, procedures for Phases II and III, and a bibliography. The final report of the study is available as Volume I (VT 005 442) and Volume II (VT 005 443). (WB)

Mr. James F. Smith
5 Vine Lane
Levittown, Pa.

Dear Mr. Smith:

Phase I, or Design Phase, of the Bucks County Study on Post High School Education Needs from 1968 through 1980 has been completed. The purpose of this phase was to determine the scope and objectives of the study, research questions to be answered, methodology to be employed, work program, budget and time estimates to carry out the work program. This report outlines in detail these major areas of concern.

The members of the Council on Post High School Education Needs, study team and clerical staff of the Bucks County Superintendent of Schools Office assigned to the study are to be commended for their diligent efforts in developing the plan for conducting Phases II and III of the study, in the time period allotted. The next few months will require many long and arduous hours on the part of the study team and clerical staff, to develop and undertake the six major surveys required by the study plan. The council will be heavily invovled in the decisioning process in Phase III beginning in October and terminating in December, 1967.

The council and study team will have produced one of the first major educational studies undertaken in the United States involving the use of advanced operations analysis techniques. I believe this study will be a "lamp-lighter" for many educational studies that will follow.

Respectfully submitted

Charles E. Brewin, Jr.

CEB:ej

Charles E. Brewin, Jr.
Assistant County Superintendent

CHAPTER I

HISTORICAL DEVELOPMENT

Introduction

This chapter contains a brief resume of the historical development leading up to and the first phase of the Study of Post High School Education Needs in Bucks County from 1968 through 1980. A continuous, detailed historical record of the study is being maintained by the Bucks County Superintendent of Schools Office.

Developments Prior to Undertaking The Study

The Bucks County Superintendent of Schools Office undertook a feasibility study to determine whether or not a community college should be established in Bucks County. A preliminary proposal for a Bucks County Community College was submitted to the Spring Convention of the Bucks County School Directors held in the Franklin D. Roosevelt Junior High School, Bristol Township on May 27, 1964. This proposal was reviewed and accepted by a majority of the Bucks County School Directors at the convention. The following resolution was passed:

> RESOLVED: That the Bucks County Convention of School Directors endorses the immediate need for the establishment of a Bucks County Community College; that sponsorship be sought at once from the Bucks County Commissioners

in accordance with the provisions of Act 484; and

that the enclosed recommendations be taken into account by the Board of Trustees of the Bucks County Community College.

In a special action at the same convention the following motion was also passed:

In view of the urgent and continuing need for higher education facilities and services, in addition to the establishment of a community college as above provided, that this County Convention endorses the establishment of college or university extension centers to serve the residents of Bucks County, AND directs the County Board to assist in whatever way it can for such provisions.

Dr. Louis Bender, Assistant Bucks County Superintendent of Schools, at the direction of Dr. George E. Raab, Bucks County Superintendent of Schools, developed plans for exploring the possibility of establishing college or university extension centers in the county. These plans included an examination and development of a record file on higher education; scholarships and loan possibilities; follow-up studies of high school students; development of channels of information concerning higher education for students, parents and the public-at-large; and the exploration of the possibility of establishing an extension center involving one or more institutions of higher learning.

A number of institutions of higher learning were contacted by Dr. Bender during the first six months of 1965. Several institutions indicated that they would be pleased to explore the possibility of a multi-institution extension center to be located within the county. Before a meeting of these institutions could be called, Dr. Bender left the county office to assume the position of Director of the Bureau of Community Colleges, Department of Public Instruction. Dr. Brewin was hired to replace Dr. Bender and assumed his duties on

September 1, 1965. Dr. Brewin was directed by Dr. Raab to ask the interested institutions of higher learning to attend a special meeting to be held at the Bucks County Community College on November 10, 1965, to discuss the possibility of establishing a multi-institution extension center. The following institutions sent representatives to the meeting: Lafayette College, Lehigh University, Lincoln University, Millersville State College, The Pennsylvania State University, Temple University, Ursinus College, Villanova University, West Chester State College, The Bucks County Community College and the county office.

The concensus of the university and college representatives who attended the meeting was that the development of an extension center involving one or more institutions of higher learning could not be profitably explored until a thorough study of the higher education needs of the county was undertaken.

Establishment of the Advisory Council

The above recommendation was referred to the Bucks County Board of School Directors at their January 18, 1966 meeting. The Bucks County Superintendent of Schools asked the board to reactivate the Bucks County Council on Higher Education for the purpose of exploring the possibility of a study of the higher education needs of the citizens of the county. Mr. James Smith, former president of the Pennsbury Board of School Directors, was asked to serve as chairman of the council. Each of the 13 local school districts, Bucks County Community College and Delaware Valley College was asked to appoint a representative to the council. The first meeting of the council was held on March 30, 1966. The discussions of the council members ranged

across the entire spectrum of post high school education needs of the county. Following the discussion the council directed the county office to develop a proposal for undertaking the study; the proposal to be submitted to the council by June, 1966.

An analysis of the discussion of the council indicated that the interest of the council embraced more than just higher education needs. Because this interest was broad-based it appeared wise to expand the council's membership to include representatives from the two vocational-technical schools, parochial and private schools, county government and business and labor. The council was expanded to its present membership by June of 1966.[1]

Mr. John Parker of the Government Consulting Service of Fels Institute of Local and State Government, University of Pennsylvania, was asked by the county office to prepare a proposal for the study which would be broad based. Because of the complexity of the problem it was necessary to provide the council with an objective means of attacking the problem. The nature of the problem and the difficulty of arriving at alternative solutions or corrective actions indicated that an operations analysis strategy was best suited for undertaking the study.

Mr. Parker and Dr. Brewin presented the Government Consulting Service's proposal for undertaking the study at the June 15, 1966 meeting of the council. The proposal outlined the scope and objectives and the three phases of the study. Phase I is concerned with developing the study design. During this period the scope and objectives of

---

[1]The title of Bucks County Council on Higher Education was changed to Bucks County Council of Post High School Education in September, 1966 because the former title did not actually reflect the concerns of the council or the scope of the study.

the study will be defined, research questions formulated, methodology developed, work program for Phases II and III outlined, budget and time estimates for the work program developed in detail and the personnel required and their responsibilities defined. Phase II of the study is concerned with conducting the various surveys required to gather the data, developing the computer model and reduction and analysis of data. Phase III is devoted to determining the priorities of the various needs identified in Phase II, alternative corrective action plans, developing the "best" corrective action plan and financial cost of the plan. The final plan will be submitted to the Bucks County Board of School Directors at their regular monthly meeting in January or February, 1968.

Funding of the Study

The Government Consulting Service's proposal was tentatively approved by the council pending funding of the study. The estimated cost of the study was $50,000. Dr. Brewin was asked to investigate the possibility of securing funds from private, state and federal sources. Twenty businesses and industries and approximately 80 union locals were contacted for financial support of the study during the next eight months. To date, a total of $4,700 has been received from these sources. Six private philanthropic foundations were contacted, none of which indicated that they were in a position to underwrite the cost of the study. Dr. John Struck, Head of the Bureau of Vocational-Technical and Continuing Education, Department of Public Instruction, was approached and indicated that the bureau was willing to underwrite the cost of the study provided Phase I was satisfactorily completed.

Dr. Struck's bureau pledged $7,500 to undertake the cost of Phase I.

Phase I Activities

The November 9, 1966 council meeting was devoted to a review and adoption of the work program for Phase I and a thorough discussion of the general objectives and scope of the study. Following the meeting the general objectives and scope paper was modified in accordance with the recommendations of the council. The council further recommended that the Bucks County Board of School Directors enter into an agreement with the Government Consulting Service of the Fels Institute of Local and State Government, University of Pennsylvania, at its regular monthly meeting on November 15, 1966. The agreement stipulates that the Bucks County Board of School Directors and the Government Consulting Service will make arrangements to engage in Phases II and III of the study pending satisfactory completion of Phase I.

The council met again on November 30, 1966 and reviewed the amended general objectives and scope paper and devoted the balance of the meeting to a thorough discussion of the preliminary research questions.

The preliminary research questions were amended during December in accordance with the recommendations of the council. The revised research questions were sent to all council members in early January, along with the suggested methodology.

The January 26, 1967 council meeting was devoted to a thorough examination of the methodology. The methodology was divided into two separate but related sections. The first section described the simulation model that will be constructed to assist in performing the

complex analyses involved in estimating the high priority unmet needs. The main function of the model will be to extend the estimates of unmet needs through time to 1980 and test the impact of various alternative plans of action designed to satisfy as many high priority needs as possible.

The second section described methods to be employed in collecting data to answer the research questions and to provide input into the simulated model. Six surveys have been suggested in addition to the collection, comparison and analysis of other data through statistical methods and the judgment of the study staff, consultants and council.

The methodology was modified following the January 26, 1967 meeting of the council. A detailed work program, revised budget and work program network for Phases II and III were discussed at the February 14, 1967 meeting of the council. During this discussion the council was informed that Dr. Struck agreed to continue support of the study, the cost of which was increased by $9,000, for Phases II and III at the maximum level of $51,500. This agreement was reached at a meeting in Harrisburg on February 9, 1967 with Dr. Struck. The council approved the work program and the revised budget.

A final report on Phase I, of which this chapter is a part, will be presented to the Bucks County Post High School Council at the March 1, 1967 meeting.

Possible Impact of the Study

The citizens of Bucks County are concerned with immediate and future post high school education needs that cannot be satisfied by existing institutions within and outside the county. Because this is one of the

largest and fastest growing counties in Pennsylvania it is essential that an intensive study be undertaken to determine the extent of these needs and how they can be satisfied. The population of Bucks County in 1950 was 144,620 and is presently estimated at 353,740. The anticipated population for 1980 will be approximately 535,900. The long term economic health of the county will be dependent, in part, upon the care with which the study is conducted and the action taken on its recommendations.

The recommendations of this study will lead to a combination of several possible courses of action which will include some if not all of the points listed below:

1. Development of various cooperative arrangements among the Community College, Delaware Valley College, vocational-technical schools, comprehensive high schools, extension centers and other institutions outside the county;

2. Establishment of at least one more community college;

3. Establishment of thirteenth and fourteenth year vocational-technical programs based on the existing vocational-technical high schools;

4. Development of various retraining and adult education programs to be offered at existing institutions within and outside the county;

5. Development of new curricula to be offered at existing institutions within and outside the county; and

6. Commitments of institutions outside the county to a fixed or increasing rate of enrollment of students in Bucks County.

The council will recommend several alternate plans of action to satisfy the present and future post high school education needs of the citizens of Bucks County. These plans of action will undoubtedly contain several of the previously mentioned possibilities as well as others as yet not perceived.

The documentation will be sufficiently detailed to permit replication of the simulation model and study procedure. Any region in the Commonwealth of Pennsylvania or other state that is faced with a similar problem which demands an identical level of detail for its input data can use the simulation model to deal with its problem.

CHAPTER II

STUDY DESIGN

Objectives

The general objectives of this study are to assist the Advisory Council in:

1. Estimating the present and future needs of residents of Bucks County for post high school education;

2. Estimating the ability of post high school resources now serving county residents to meet anticipated future needs for post high school education;

3. Determining factors which restrict the opportunities of county residents in obtaining needed post high school education; and

4. Identifying courses of action available to the county to overcome future deficiencies in post high school education resources as compared with estimated needs. The courses of action developed by the council will include some if not all of the following points:

   a. Development of various cooperative arrangements among the Community College, Delaware Valley College, vocational-technical schools, comprehensive high schools, extension centers and other institutions outside the county;

   b. Establishment of at least one more community college;

   c. Establishment of thirteenth and fourteenth year vocational-technical programs based on the existing vocational-technical high schools;

   d. Development of various retraining and adult education programs to be offered at existing institutions within and outside the county;

   e. Development of new curricula to be offered at existing institutions within and outside the county, and

f. Commitments of institutions outside the county to a fixed or increasing rate of enrollment of students in Bucks County.

Scope

In addition to the general objectives, the following statement of the scope of the study was used to prepare detailed research questions (see Appendix) which then determined the content more specifically.

1. Present and future post high school education needs of county residents will be examined for both graduating high school students and for the adult population as a whole. Within the adult population, attention will be given to those who have not completed high school as well as those who are high school graduates.

2. Employment practices and education requirements, and unmet employee education needs within Bucks County will be ascertained from major employers and labor organizations in Bucks County.

3. Present and future employment opportuniities by occupational groups will be determined for Bucks County and for the three primary employment centers most accessible to Bucks County residents: the Philadelphia-Camden Standard Metropolitan Statistical Area (SMSA), the Trenton SMSA, and the Allentown-Bethlehem SMSA.

4. Post high school educational resources receiving primary attention will be those within Bucks County and those within daily commuting distance (approximately 45 minutes traveling time) of population centers in Bucks County. All educational resources beyond daily commuting distance of residents of Bucks County will be treated by general category and receive secondary emphasis. Actual patterns of utilization and relevance to established needs of Bucks County residents will determine the relative intensity of study of educational resources in both categories.

5. In examination of educational resources, the emphasis will be on the capacity of the resources to meet needs of Bucks County residents, and will not extend to an evaluation of individual institutions and programs.

6. Greatest emphasis will be placed on present unmet needs that are expected to increase through 1980; secondary emphasis on present unmet needs expected to decrease through 1980; mini-

mum emphasis on needs currently satisfied but estimated to become larger than available resources by 1980.

7. Examination of courses of action will give greatest emphasis to public institutions and programs now within, or potentially within, Bucks County.

General Methodology

This study will begin with an intensive analysis on a broad front of the present and future needs for post high school education of the residents of Bucks County. This approach is somewhat unique, for many prior studies both in the county and in the commonwealth as a whole have approached post high school education needs on a narrow front i. e., they have generally been concernad with a specific programmatic or organizational objective.

The approach taken in the conduct of this study is also noteworthy for the major contribution which will be made by the Advisory Council. The individual members of the council will be deeply involved in the decision process, leading to development by the council of a series of recommendations based on the content of the base line study and the major alternatives revealed in the base line study as presented by the study staff. The close interaction of the council and the study staff should produce results of exeptional value to various agencies within Bucks County when these agencies consider what action shall be taken to meet the needs of county residents for post high school education.

Phase I: Study Design

There are three major states, or phases, in this study; this report represents the conclusion of the first stage, or design phase.

The objectives of this phase were:

- Development of a series of detailed questions to be answered in achieving the general objectives of the study. (See Research Questions, Appendix A.)

- Identification and evaluation of available data, reports, predictions and plans of potential value in carrying out the study. (See List of Resources, Appendix C., and Bibliography)

- Determination of requirements for collection of additional data and for special surveys. (See Data Collection Methods, Appendix B.)

- Development of methodology for estimating unmet needs for a particular educational program in a specific geographic area. (See Study Procedure, Appendix D.)

- Development of a work program and schedule. (See Detailed Work Program section, and the schedule shown in this General Methodology section.)

Phase II: Conduct of the Study and Preliminary Report

The objective of this phase is to carry out the work program developed in the Study Design Phase. At the conclusion of this phase the study staff will prepare a preliminary report containing all factual analyses. (See Phases II and III - Study Procedure, Appendix D, for a more detailed description of methodology and the way unmet needs will be estimated.)

The preliminary report will include detailed projections of requirements and resources, and analyses of major deficiencies in post high school education opportunities for the citizens of the county.

The council will be consulted on questionnaire content during one meeting in April, 1967; two other meetings will report progress of the study. Phase II will begin in February of 1967 and will be completed in October of 1967.

Phase III: Conclusions and Final Report

The objectives of the final phase of the study is to apply the judgmental values of the Advisory Council to the factual results obtained in Phase II and set forth in the preliminary report. The study staff will define major alternatives and identify principle advantages and disadvantages of each, for the purpose of aiding the council in its deliberations and will also provide a computer program which will facilitate evaluation of many combinations of corrective actions that might be taken to alleviate estimated unmet needs. Two all-day meetings are scheduled during October, 1967, at which times the council and the study staff will establish priorities on major unmet needs and determine the most effective combination of corrective actions.

It is expected that the intense collaborative effort between the Advisory Council and the study staff will result in a final report that spells out several feasible "Policy Plan" alternatives that will be directly aimed at satisfying the post high school education needs of Bucks County from 1968 through 1980. Using the computer model and computer tapes of survey data as a foundation, a periodic updating procedure will be developed to insure that future plans can be adapted to fit the ever-changing socio-economic conditions of Bucks County and the Greater Philadelphia Metropolitan Region in which it is imbedded.

Phase III, including preparation of the final report, is scheduled to take place from October 1967 to January 1968.

Schedule

The fold-out sheet on a following page shows the completion points for major elements of the various work programs; it also shows when council meetings will be held and the primary reason for each meeting. The numbers in the circles refer to events listed on the Key Index (pages opposite the fold-out); numbers with 0 after the dot are council meetings.

This particular "event network" is considered to be extremely tight, with little or no slack time and a minimum number of council meetings. If difficulties arise on any work program, or if the council later feels the need for more meetings, the probable effect will be to extend the completion date of the study beyond January 31, 1968.

The scheduled council meetings are:

3/1/67	1.0	Council approve Phase I report, financing and study as a whole.
4/5/67	2.0	Council review survey preparations and questionnaires.
6/7/67	3.0	Progress report to council.
9/7/67	4.0	Council review preliminary Phase II analysis and survey results.
10/12/67	5.0	All day meeting - council establish priorities and propose corrective actions.
10/26/67	6.0	All day meeting - council evaluate corrective actions and propose Policy Plans.
11/15/67	7.0	Council selects Policy Plans for final report and other recommendations.
12/14/67	8.0	Council review Policy Plans and first draft of final report.
1/31/68	9.0	Council endorses final report to Bucks County Board and Bureau of Vocational, Technical and Continuing Education, Department of Public Instruction

5. 1 Complete Definiation of Courses of Action
5. 2 Complete Analysis of High School Senior Follow-up Survey
5. 3 Complete Revised Phase II Analysis
5. 4 Complete Computer Model Revised Analysis
5. 5 Complete Impact Analysis of Courses of Action

6. 0 Council Evaluate Courses of Action and Propose Policy Plans (All Day)
6. 1 Complete Definitions of Policy Plans
6. 2 Complete Financial Analysis of Policy Plans

7. 0 Council Select Final Policy Plans and Recommendations
7. 1 Complete Draft of Policy Plans and Recommendations
7. 2 Complete Draft of Study Report
7. 3 Complete Draft of Summar Report
7. 4 Complete Technical Reports
7. 5 Complete Up-Dating Procedures

8. 0 Council Review Policy Plans and Draft Reports
8. 1 Complete Final Report
8. 2 Complete Summary Report
8. 3 Complete Printing of Reports

9. 0 Forward Final Report to County Board and DPI
9. 1 Complete Study Administration

3. 0 Council Review Progress
3. 1 Complete Computer Model "Debugging"
3. 2 Complete Adult Classes Survey
3. 3 Complete Computer Model Testing
3. 4 Complete Collection of High School Senior Record Data
3. 5 Complete Adult Sample Survey
3. 6 Complete Processing of High School Senior Data and Returns
3. 7 Complete Processing of Adult Survey Returns
3. 8 Complete Processing of Employer Survey Returns
3. 9 Complete Processing of Institution Survey Return
3.10 Complete Computer Programming - High School Senior Surveys and Records Analysis
3.11 Complete Keypunching - High School Senior and Record Data
3.12 Complete Computer Programming - Adult Survey Analysis
3.13 Complete Keypunching - Adult Survey Analysis
3.14 Complete Code and Keypunch - Employer Survey Data
3.15 Complete Computer Programming - Employer Survey Analysis
3.16 Complete Code and Keypunch - Institution Survey Data.
3.17 Complete Computer Programming of Institution Survey Analysis
3.18 Complete High School Senior Survey and Records Analysis
3.19 Complete Adult Survey Analysis
3.20 Complete Employer Survey Analysis
3.21 Complete Institutionsl Survey Analysis
3.22 Mail High School Senior Follow-up Survey
3.23 Complete Computer Model Validity Runs

4. 0 Council Review Preliminary Phase II Analysis
4. 1 Complete Processing of High School Senior Follow-up Returns
4. 2 Complete Computer Model Analysis Runs
4. 3 Complete Unmet Needs Classifications and Analysis
4. 4 Complete Keypunching of High School Senior Follow-up Data

5. 0 Council Establish Priorities and Propose Courses of Action (All Day)

BUCKS COUNTY POST HIGH SCHOOL EDUCATION STUDY

KEY INDEX TO THE EVENT NETWORK

1. 0 Council Approve Study
1. 1 County Board and DPI Approve Study
1. 2 Complete Definitions and Classifications for Questionnaires and Records
1. 3 Complete Preparations and Procedures - High School Senior Follow-up Survey
1. 4 Complete Questionnaire - High School Senior Survey
1. 5 Complete Questionnaire - Adult Survey
1. 6 Complete Questionnaire - Employer Survey
1. 7 Complete Questionnaire - Institution Survey
1. 8 Complete Preparations and Procedures - High School Senior Survey
1. 9 Complete Preparations and Procedures - High School Senior Records
1.10 Complete Preparation and Procedures - Adult Classes Survey
1.11 Complete Preparations and Procedures - Adult Sample Survey

2. 0 Council Review Survey Preparation
2. 1 Complete Pre-Test High School Senior Survey
2. 2 Complete Printing Questionnaires and Instructions - High School Senior Survey
2. 3 Complete Computer Model Development
2. 4 Complete Preparations and Procedures - Employer Survey
2. 5 Complete Preparations and Procedures - Institution Survey
2. 6 Draw Adult Samples
2. 7 Complete Population Projections, Procedures, and Format
2. 8 Complete High School Senior Survey
2. 9 Complete Arrangements for Enumerators
2.10 Complete Mailing - Employer Survey
2.11 Complete Mailing - Institution Survey
2.12 Complete Pilot Test of Adult Sample Survey
2.13 Complete Printing - High School Senior Records Form
2.14 Complete Training of Enumerators
2.15 Complete Population Projections
2.16 Complete Validity Check of High School Records Senior Survey
2.17 Complete Computer Model Programming
2.18 Complete Questionnaire - High School Senior Follow-up Survey
2.19 Complete Printing Questionnaires and Manuals - Adult Survey

IN BUCKS COUNTY 1968-1980

-1980 PHASES II AND III

OCT.1 NOV.1 DEC.1 J

RK PROGRAM AND SCHEDULE (MARCH 196

EY

PHASE III DECISION PR

ND III

JAN. 1, '68 FEB. 1

MARCH 1967 THROUGH JANUARY 1968)

SION PROCESS

Evaluation

The design for the evaluation is divided into two parts. The first part is concerned with an internal evaluation of the efficacy of each of the three phases of the total study. Each phase will be subjected to an intensive evaluation by specialists representing the following fields: governmental management and finance, community college education, vocational-technical education, demography, community analysis and planning, statistics and operations research.

The second part of the evaluation is concerned with an assessment of the substance of the final report by the above mentioned specialists. This report will be primarily concerned with a number of feasible alternatives for meeting the post high school education needs of the citizens of Bucks County from 1968 through 1980. The specialists will address themselves to the efficacy of these alternatives for action in terms of their consistency with the data and projections as revealed in the preliminary report.

The action taken by the following agencies in implementing one or more of these alternatives will also be evaluated: Bucks County Board of School Directors, three vocational-technical boards of school directors, 13 individual school system boards of directors, Bucks County Commissioners, Bucks County Community College Board and other appropriate agencies. It is in the nature of the action taken by these agencies that the full impact and value of the study can be judged.[1]

---

[1]The major share of the funding of the alternatives will be borne by these agencies and the state and federal government.

CHAPTER III

DETAILED WORK PROGRAM

2.1 Computer Model

Objectives

The major purposes are:

1. To provide a tool for comparing alternative Council actions in terms of quantitative estimates of educational needs of Bucks County residents.

2. To provide a means of up-dating, checking and correcting the study in the future.

A computer program will be written in FORTRAN language which basically will compare Bucks County residents' desires for further education or training with the capacity to supply the amounts and types of education or training desired, within Bucks County and a commuting area around it. The program will provide projections of such comparisons through 1980 and will be designed to easily allow changes in

- variables deemed controllable to some extent by decisions of the Bucks County Council;

- parameters which are not controllable, cannot presently be estimated accurately, and yet have an important effect on the comparisons being made; and

- basic descriptive data about Bucks County residents, educational institutions in the area, and projections of these figures.

The first purpose will be fulfilled by allowing changes in the "controllable variables," and through assumptions which will permit quantitative estimates of educational needs. The second purpose will be fulfilled by allowing for changes in parameters and data; the estimates of educational need can be recalculated easily once the basic data

is collected in future years.

Available Resources

The Fels Institute staff, and the University of Pennsylvania Computing Center will be used for programming services and computer time. Use of the FORTRAN language will make the program useable on other computers (though not on any computer within any Bucks County governmental unit, due to the large scale computer configuration required).

Major Components

2.1.1 Design and develop model: Basic assumptions, all formulas needed, and all methods of allocation will be developed; a technical paper will be written to describe the methods used.

2.1.2 Programming: The model will be flowcharted and programmed for the University of Pennsylvania computer, using the FORTRAN computer language. All input-output programs will be prepared.

2.1.3 Debug: The program will be checked extensively for errors.

2.1.4 Testing: A working version of the model, using artificial data, will be developed and tested to insure that the program works correctly.

2.1.5 Validity runs: Several experimental runs using actual data will be needed to gain estimates on proper range of values for the most important "internal" parameters.

2.1.6 Analysis Runs: After parameters have been set, other runs will be needed for the final Phase II analysis, to investigate effects of errors in population projections and institutional capacity projections.

2.1.7 "Corrective Action" Runs: After priority classes have been established, a series of runs will be needed to investigate effects of changing controllable variables, as specified by Fels Staff and by Bucks County Council members.

Time Required

About 18 professional man-weeks of Fels Institute staff time will be needed for all programming. Model testing will be completed by June 15.

Responsibility

Fels Institute staff will assume all responsibility for this study activity.

Estimated Cost

About $10,800 in Fels staff time, plus about $4,100 in computer time and related data processing. Total = $14,900.00

2.2 Data Projections

Objectives

Estimates of Bucks County population growth (by school district, if possible), through 1980 will be needed to:

- indicate changes in education needs by 1980 due to changes in numbers of people in Bucks County
- provide basic data for the computer model

Projections of other education trends regarding use and types of post high school educational programs will also be needed to:

- indicate changes in needs due to gradual changing of emphasis on different types of programs and motivations of potential students
- provide data for calculating parameters needed in the computer model.

Available Resources

Estimates of Bucks County population through 1980 are available from Delaware Valley Regional Planning Commission, Temple University and Bucks County Planning Commission. Fels Institute staff will prepare more detailed estimates using data from these sources. Educational trends will be taken from data in available publications.

Major Components

2.2.2.1 Bucks County population projections, by school district.

2.2.2.2 Pertinent educational trends - locate and adapt to survey data.

Time Required

About two man-weeks of Fels Institute staff time will be needed to construct population projections and compute parameters from trend data. Data should be ready by the end of April.

Responsibility

Fels Institute will assume complete responsibility.

Estimated Cost

About $1,000 in professional staff time.

2.3 Survey of Educational Institutions

Objectives

An accurate picture of available educational and training resources in the Bucks County area is needed. This survey will cover such resources

as completely as possible and will ask for data on admission requirements, costs, capacity, plans for expansion and programs offered.

Available Resources

The Pennsylvania Department of Public Instruction and the Bucks County Board of School Directors have lists of institutions. Fels Institute staff will conduct entire survey; contract keypunching will be needed.

Major Components

2.3.2 Develop mailing lists and questionnaires

2.3.3 Mail out and receive back

2.3.4 Check answers, call non-responders.

The first effort will be a mailed questionnaire. If tardy or questionable, follow-ups will be made by telephone.

2.3.5 Code and keypunch

2.3.6,7 Summarize and analyze; write up results.

Time Required

About five man-weeks of Fels Institute staff time. Data should be ready for keypunching in June.

Responsibility

Fels Institute will assume complete responsibility.

Estimated Cost

About $2,600 in Fels Institute staff time, $200 for computer time and $200 for contract keypunching. Total = $3,000.

2.4 Survey of Large Employers in Area

Objectives

This survey will be designed to learn:

- extent and nature of in-plant training programs
- numbers and types of jobs available, with educational requirements
- nature of tuition payment programs for employees who enroll in adult education courses

Data will be used to develop parameters for allocation of adults to educational programs.

Available Resources

Fels Institute staff; Dun and Bradstreet listing of area employers.

Major Components

2.4.1,2 Preparation - questionnaire, mailing lists

2.4.3,4 Mail and receive replies; check by telephone

2.4.5,6 Analyze data and write report

Time Required

About three man-weeks of Fels Institute staff time.

Responsibility

Fels Institute will assume complete responsibility.

Estimated Cost

About $1,700 in Fels Institute staff time, $100 for contract key-punching and $100 in computer time. Total = $1,900.

2.5 Survey of High School Seniors

Objectives

A survey of all high school seniors in Bucks County schools is needed to obtain accurate data on socio-economic characteristics, aspirations and plans of seniors for further education.

Available Resources

Fels Institute staff, Bucks County School Board personnel and local school officials and guidance counselors will be made available. A consultant will be used to insure validity of the questionnaire; keypunching will be contracted out.

Major Components

2.5.1 Procedures: All pertinent characteristics with related categories will be identified.

2.5.2 Preparation: A manual of instructions for people administering questionnaires and a booklet for seniors to keep, which explains the study, will be prepared. The questionnaire will be designed and arrangements made with each school to have all seniors answer the questions under supervised conditions.

2.5.3 Conduct Survey: All seniors will fill in answers during arranged-for time, with opportunity to get clear understanding of each question.

2.5.4.1 Code and Keypunch: The completed questionnaires will be checked quickly for invalid ones. Data will be keypunched by contract.

2.5.4.2 Select Sample for Follow-up Survey: The valid questionnaires will be sampled and guidance counselors will contact each "sample senior" individually to check answers, inform him of plans for follow-up and request cooperation.

2.5.5.6 Data Analysis: Data on punched cards will be analyzed using available statistical analysis computer programs; data for computer model will be calculated.

2.5.7 Write-up of Results: A technical report will be written giving an interpretative analysis of the survey results (including data from school records and follow-up surveys).

Time Required

About four man-weeks of Fels Institute staff time, 38 man-weeks of Bucks County professional time and 24 man-weeks of Bucks County clerical staff time.

Responsibility

Bucks County will design questionnaire, arrange for and conduct the survey, code and check completed questionnaires and arrange for keypunching. Fels Institute will be responsible for overall procedures and data analysis and will write a technical report on results.

Estimated Cost

About $2,400 for Fels Institute staff, $1,000 for keypunching, $600 for computer time, $12,380 for Bucks County staff time, $500 for printing booklets and manuals and $300 for a consultant. Total = $17,180.

2.6 School Records Data

Objectives

Data on achievement scores, I. Q. scores and class standing are needed to complete the set of characteristics of high school seniors.

Available Resources

Confidential cumulative folders are kept for each school child, recording data on progress through school. Guidance counselors have access to these folders and can copy off certain items onto data forms. Bucks County clerical help; contract keypunching.

Major Components

2.6.1 Procedures

2.6.2 Preparation

2.6.3.4 Collect data and spot check; guidance counselors will probably copy and code the data

2.6.5 Code and keypunch

2.6.6 Combine with survey data

Time Required

About four man-weeks of Bucks County professional time and 24 man-weeks of Bucks County clerical time.

Responsibility

Bucks County will create data form, arrange for copying data from folders, code the data and arrange for keypunching. Fels Institute will set overall procedures and oversee the combining of school records data with survey data.

Estimated Cost

About $200 for keypunching, $200 for computer time, $4,240 Bucks County staff time, $100 for printing forms and instructions and $1,500 to compensate the guidance counselors. Total = $6,240.

2.7 Follow-up Survey of High School Seniors

Objectives

A follow-up survey is needed to determine how closely the high school seniors adhere to the plans and aspirations expressed in their responses to the survey questionnaire.

Available Resources

A 20% sample of seniors will be chosen before graduation and guidance counselors will obtain names and addresses. Bucks County staff; Fels Institute staff; contract keypunching.

Major Components

2.7.1 Procedures

2.7.2 Preparation

2.7.3.4 Mail, receive, and check; non-respondents will be followed-up by telephone

2.7.5 Code and keypunch

2.7.6.7 Data analysis

Time Required

About two man-weeks of Fels Institute staff time, 10 man-weeks of Bucks County professional staff time and 20 man-weeks of Bucks County clerical time.

Responsibility

Bucks County will up-date addresses of sample, construct questionnaire, mail out material, check non-respondents, code completed ques-

tionnaires and arrange for keypunching. Fels Institute will set procedures and analyze the data. Keypunching will be contracted out.

Estimated Cost

About $1,200 for Fels Institute staff, $200 for keypunching, $200 for computer time, $5,480 for Bucks County staff, $150 mailing costs, $100 printing costs and $100 for telephone costs. Total = $7,430.

2.8 Survey of Bucks County Adults

Objectives

The major purpose of the adult survey is to obtain good estimates of the characteristics of the Bucks County adult population and interest in more education or training. In addition, data is needed on adults already enrolled in adult education, to find out factors influencing their decision to enroll.

Available Resources

Local school boards used enumerators to collect school census data; these enumerators will be contacted and hired to conduct the adult sample.

Punch cards resulting from the previous school census will be used to select a 5% sample of dwelling units.

Bucks County staff (including EDP personnel familiar with school census cards) will be made available; Fels Institute staff; contract keypunching.

Major Components

2.8.1 Procedures

2.8.2.1 Draw Sample - a 5% sample of dwelling units, with addresses, will be selected from the 400,000 card file of Bucks County school census and land parcel data. Records of new building permits will also be sampled to obtain data from people in new dwelling units.

2.8.2.2 Enumerators - people previously used for school census enumeration will be hired to conduct the survey; Bucks County personnel will supervise the field work.

2.8.2.3,4,5 Questionnaire, booklet, manual

2.8.2.6 Pilot survey

2.8.3.1 Conduct survey by enumerators

2.8.3.2 Survey of adult educatinn classes within Bucks County - each class instructor will be asked to make a short period of class time available to fill out questionnaires.

2.8.4 Spot check on enumerators - telephone calls will be made to check a few households visited by each enumerator.

2.8.5 Code and Keypunch

2.8.6 Data analysis

2.8.7 Write-up results

Time Required

About four man-weeks of Fels Institute staff time, 33 man-weeks of Bucks County professional staff time and 38 man-weeks of Bucks County clerical staff time.

Responsibility

Bucks County staff will draw sample, construct questionnaire, hire enumerators, arrange for pilot survey and spot checks, arrange for adult education class participation, arrange for coding questionnaires and arrange for keypunching. Fels Institute will set overall procedures

and data requirements, analyze the data and write a technical report on the results.

Estimated Cost

About $2,400 Fels Institute staff, $1,900 for keypunching, $400 computer cost, $14,760 Bucks County staff, $1,000 printing costs for booklets and manuals, $750 Bucks County EDP costs for drawing sample, $3,800 for hired enumerators and $100 telephone costs. Total = $25,110.

2.9 Administration

Objectives

Considerable effort will be required to:

- attend meetings, control finances, plan work schedules, etc. (maintain control of study and the separate surveys)
- write technical reports for inclusion in the final report
- disseminate information about the study to the widest possible audience

Available Resources

Fels Institute staff; Bucks County professional staff.

Major Components

2.9.2 Administration - control

2.9.3 Technical reports

2.9.4 Public information

Time Required

About six man-weeks of Fels Institute staff time, 30 man-weeks of Bucks County professional staff time and 30 man-weeks of Bucks

County clerical staff time.

Responsibility

Bucks County will assume responsibility for public information administrative effort relative to surveys; paying students and other hired help and production of reports. Fels Institute will retain primary responsibility for study as a whole, overall coordination of data collection and analysis and use of consultants.

Estimated Costs

About $3,600 Fels Institute staff time, $12,600 Bucks County staff time, $2,700 for advisors, $1,500 for Fels staff travel, $1,500 for Bucks County staff travel and $1,200 for office services and supplies. Total = $23,100.

2.10 Phase II Analysis

Objectives

After the data collection and analysis for individual surveys has been completed, an overall analysis must be prepared to estimate the kinds and amounts of unmet needs and to suggest priority classes. This analysis will form the basis for the Advisory Council's deliberations on priority needs, corrective actions that can be taken and policy plans the Council could adopt.

Available Resources

Results from all surveys must be available. The computer model will also be available. Fels Institute staff, University of Pennsylvania

computer Center, Bucks County professional staff, Study advisors.

Major Components

2.10.1 Preliminary Analysis - a brief summary (using incomplete data if necessary), without the data from the high school seniors follow-up survey, will be presented to the Bucks County Council as soon as possible in the fall of 1967.

2.10.2 Final Phase II Analysis - after all data is in and processed, a final analysis will be made to incorporate the follow-up survey of seniors and any other changes.

2.10.3 Final Phase II Report - a report will be written, giving an objective interpretative analysis of the data collection, analysis and estimates of unmet needs.

Time Required

About four man-weeks of Fels Institute staff time, eight man-weeks of Bucks County professional staff time and eight man-weeks of Bucks County clerical staff time.

Responsibility

Fels Institute will retain complete responsibility for the analysis, though the final analysis and report will be a cooperative effort with the Bucks County professional staff and study advisors.

Estimated Costs

About $2,400 for Fels Institute staff, $3,360 for Bucks County staff. Total = $5,760.

3.0 Phase III - Council Decisions

Objectives

The purpose of Phase III is to use the Phase II analysis, which will give estimates of the present and projected situation with regard to post high school education in the Bucks County area,as a basis for:

- determining high priority needs
- developing alternative actions to alleviate or meet the indicated needs
- developing alternative policies to implement the actions deemed "best" by the Council
- Choosing the policy plan which
  - concentrates on the most important needs
  - fits the financial resources available
  - pinpoints areas for further study.

The Phase II analysis will form the "base case" for establishing priorities; the computer model will provide an indispensable tool for investigating alternatives.

Available Resources

The Bucks County Council members; Bucks County staff; Fels Institute staff; Phase II analysis; computer model.

Major Components

3.1 Establishing priorities - using a list of priority classes derived from the unmet needs estimated in Phase II analysis, the Bucks County Council and the study staff will gather for a day of concentrated work to:

- review the Phase II anaylsis and implications
- suggest additional priority classes

- establish priorities

- prepare corrective actions for highest priority needs.

3.2 Evaluate Corrective Actions - another day of concentrated effort by the Council and study staff will be scheduled to:

- review and discuss computer evaluation of corrective actions

- prepare other corrective actions and use computer model immediately to obtain past evaluation of proposals

- choose best combinations of corrective actions

3.3 Develop Policy Plans - the study staff will investigate implications of possible Council actions and related financing methods prior to a Council meeting to choose the best policy plan.

3.4 Issue Final Report and Summary - the final report will outline the final policy plan and all recommendations and should be ready for presentation to the Bucks County Board at the February 1968 Board meeting. Several thousand copies will be printed for local and national distribution.

Time Required

About five man-weeks of Fels Institute staff time, ten man-weeks of Bucks County professional staff time and ten man-weeks of Bucks County clerical staff time.

Responsibility

Fels Institute and Bucks County professional staff will work together closely during the decisioning phase to provide all needed support for the Council's activity. Fels Institute will be primarily responsible for analytical support. Bucks County professional staff will assume responsibility for production of the final report.

Estimated Costs

About $3,000 for Fels Institute staff time and $4,920 for Bucks County staff time. Total = $7,920.

CHAPTER IV

BUDGET AND TIME ESTIMATES

Because the Government Consulting Service is a non-profit element of the Fels Institute, it charges only for actual costs incurred in its contribution to the conduct of the study. Hence the reimbursement request($45,900) is not stated as a fixed fee but only as an estimate of cost based on the scope and complexity of the work to be done. The total estimated cost of Phases II and III of the study including local expenditures is expected to be approximately $113,540.

The facilities of the Bucks County Planning Commission and Electronic Data Processing Departments will be made available for the study and represent a substantial financial commitment on the part of the county commissioners to the study. A similar contribution of personnel time will be made by the Bucks County Board of School Directors, Bucks County Community College, public school systems, private and parochial secondary schools, vocational-technical schools, institutions of post high school training within the Greater Philadelphia Metropolitan Area and industrial and commercial firms located within the county. The Bucks County Board of School Directors will also contribute funds for special advisors, staff travel, office services and supplies and the reproduction of the final report. The total cost of these contributions will amount to approximately $62,040.

The first table in this section is a summary of estimated Phase II and III costs by major cost elements, with separate totals for fiscal

years 1967 and 1968. The second table shows a different cost summary by major work program items.

BUDGET - PHASES II AND III

Cost Estimate by Major Cost Elements (Dollars)

	March-June, 1967			July '67-Feb. '68			Total, March '67-Feb.'68		
	Fels	Local	Total	Fels	Local	Total	Fels	Local	Total

CHAPTER V

REPORTING AND DISSEMINATION OF RESULTS

This chapter contains a minimum information and dissemination program. The program will be expanded at the end of Phase II, during Phase III and at the termination of Phase III as additional information requirements become known to the study team and the council.

The purposes for reporting and disseminating information during Phase II and III are to inform the educational and lay community in Bucks County and the nation of the study, its objectives and findings and to encourage other educational agencies to replicate the study.

3/1 - 3/31/67	A progress report will be made to the Bureau of Vocational, Technical and Continuing Education, Department of Public Instruction on the activities of Phase I and the projected activities of Phases II and III.
	Superintendents of schools, high school principals and high school guidance counselors of private, parochial and public schools and school systems will be contacted during the month to apprise them of the study and the high school senior survey to be conducted during the month of April.
	Census enumerators and directors of adult education classes in the county will be contacted during the month and apprised of the adult surveys to be conducted during the months of April through June.
	A news release will be prepared early in March for distribution through the "Bucks County School Directors Newsletter", local and regional newspapers.
	Copies of the "Phase I Progress Report", will be distributed to several selected agencies and organizations in the Commonwealth of Pennsylvania and in other states.

3/ 7/67	Luncheon and news conference for industrial and business firms who contributed to the study. The luncheon and news conference will be held at Conti's Cross Keys Restaurant, Doylestown.
3/21/67	A progress report on Phase I and projected activities for Phases II and III will be made at the regular March meeting of the County Board of School Directors.
3/31/67	Regular monthly progress report and request for operating funds will be prepared and presented to Dr. Struck, Head, Bureau of Vocational, Technical and Continuing Education, Department of Public Instruction.
4/1 - 4/30/67	A special "coffee clatch" will be arranged for interested council members to discuss in detail the methodology employed in this study. A letter will be sent to service organizations throughout the county indicating that Dr. Brewin will be available to speak at their meetings on the Bucks County Post High School Study. A special information campaign involving letters and news releases will be prepared to announce the high school senior survey and the adult surveys.
4/ 5/67	Survey materials will be reviewed at the April council meeting for possible changes.
4/30/67	Regular monthly progress report and request for operating funds will be prepared and presented to Dr. Struck, Head, Bureau of Vocational, Technical and Continuing Education, Department of Public Instruction.
5/ 1 - 5/31/67	Dr. Brewin will address interested service clubs concerning the Bucks County Post High School Study during this month. News release will be prepared for use in the "Bucks County School Director Newsletter" and local and regional newspapers concerning the progress to-date of the study.
5/31/67	Regular monthly progress report and request for operating funds will be prepared and presented to Dr. Struck, Head, Bureau of Vocational, Technical and Continuing Education, Department of Public Instruction.

6/1 - 6/30/67	Dr. Brewin will continue to address any service club within the county that wishes information concerning the study. News releases will be prepared for the "Bucks County School Director" and local and regional newspapers, on the progress of the study.
6/ 7/67	A progress report of the activities to-date in Phase II of the study will be presented to the Council.
6/30/67	Regular monthly progress report and request for operating funds will be prepared and presented to Dr. Struck, Head, Bureau of Vocational, Technical and Continuing Education, Department of Public Instruction.
7/31/67	Regular monthly progress report and request for operating funds will be prepared and presented to Dr. Struck, Head, Bureau of Vocational, Technical and Continuing Education, Department of Public Instruction.
8/31/67	Regular monthly progress report and request for operating funds will be prepared and presented to Dr. Struck, Head, Bureau of Vocational, Technical and Continuing Education, Department of Public Instruction.
9/ 1 - 9/30/67	Dr. Brewin will continue to speak before service groups within the county upon request. Publicity releases will be prepared for the "Bucks County School Director Newsletter" and local and regional newspapers.
9/ 7/67	The preliminary report outlining the analysis of data gathered during Phase II will be presetned to the council. This report will be disseminated to the Bureau of Vocational, Technical and Continuing Education, Department of Public Instruction and other agencies and organizations in the Commonwealth of Pennsylvania and other states.
9/20/67	A progress report on Phase II activities will be presented to the county board at its regular monthly meeting.

9/30/67 Regular monthly progress report and request for operating funds will be prepared and presented to Dr. Struck, Head, Bureau of Vocational, Technical and Continuing Education, Department of Public Instruction.

10/ 1 - 10/31/67 Dr. Brewin will continue speaking to service groups upon request.

Publicity releases will be prepared for the "Bucks County School Directors Newsletter" and local and regional newspapers.

10/12/67 An all day meeting of the council will be devoted to establishing priorities and possible courses of action.

10/26/67 Another all day meeting of the council will be devoted to evaluating alternative courses of action and the development of policy plans.

10/31/67 Regular monthly progress report and request for operating funds will be prepared and presented to Dr. Struck, Head, Bureau of Vocational, Technical and Continuing Education, Department of Public Instruction.

11/ 1- 11/30/67 Dr. Brewin will continue speaking to service groups upon request.

Publicity releases will be prepared for the "Bucks County School Directors Newsletter" and local and regional newspapers.

11/15/67 The council will select a final policy plan and recommendations.

11/31/67 Regular monthly progress report and request for operating funds will be prepared and presented to Dr. Struck, Head, Bureau of Vocational, Technical and Continuing Education, Department of Public Instruction.

12/ 1 - 12/31/67 Dr. Brewin will continue speaking to service groups upon request.

Publicity releases will be prepared for the "Bucks County School Directors Newsletter" and local and regional newspapers.

12/14/67 The council will review the final policy plans, recommendations and draft reports.

12/31/67 Regular monthly progress report and request for operating funds will be prepared and presented to Dr. Struck, Head, Bureau of Vocational, Technical and Continuing Education, Department of Public Instruction.

1/31/68 Regular monthly progress report and request for operating funds will be prepared and presented to Dr. Struck, Head, Bureau of Vocational, Technical and Continuing Education, Department of Public Instruction.

The final report of the Bucks County Council on Post High School Education will be completed and presented to the council at its final meeting. This report will be presented to the Bucks County Board of School Directors at its regular monthly meeting in February. The report, in sufficient quantity, will be submitted to the Bureau of Vocational, Technical and Continuing Education, Department of Public Instruction. Copies of the report will also be distributed to selected agencies and organizations throughout the Commonwealth of Pennsylvania and other states.

A special Summary of the report will also be prepared and used for wide distribution throughout the United States.

A special information and dissemination program will be developed and incorporated in the final report. The purpose of this program will be to stimulate interest in acting upon the recommendations of the study and in replicating the study.

APPENDIX A

Revised Research Questions

I. What are the needs (by school district) for post high school education of high school seniors?

A. What do they want to do?

1. What type of post high school institution do they want to attend? Part-time? Full-time? Day? Evening?

2. What type of educational program do they wish to pursue? Initially? Ultimately?

3. What are the occupational career interests of high school seniors and adults for the immediate future?

B. What do they plan or expect to do?

1. What post high school institution do they plan to attend? Part-time? Full-time? Day? Evening?

2. What type of educational program do they plan to pursue now?

3. For those whose immediate plan is work only, what reasons do they give for not continuing their education?

4. What type of program have they applied for, if any?

C. What can they afford to do?

1. To what extent have they made financial plans, including work arrangements, to support their interests in post high school education?

2. What is the maximum contribution their families feel they can make annually toward support of their interests in post high school education?

3. To what extent have high school seniors applied for college scholarships and what is their value as a proportion of total cost?

D. What post high school educational opportunities are they qualified for?

1. What are the abilities of high school seniors?

2. What are the adults and high school seniors eligible for?

E. What differences exist, if any, between what they desire, plan, can afford, and are qualified to do?

1. How do aspirations compare with expected achievement?

2. How do qualifications compare with achievement aspirations?

3. How do financial plans compare with achievement aspirations?

II. What are the needs for post high school education of adult high school graduates and adults who are not high school graduates?

A. What do they want to do?

1. What type of post high school institution do they want to attend? Part-time? Full-time? Day? Evening?

2. What type of educational program do they wish to pursue? Initially? Ultimately?

3. What are the occupational career interests of adults for the immediate future?

B. What do they plan or expect to do?

1. What post high school institution do they plan to attend? Part-time? Full-time? Day? Evening?

2. What type of educational program do they plan to pursue now?

3. For those whose immediate plan is work only, what reasons do they give for not continuing their education?

4. What type of program have they applied for, if any?

5. What type of program are they now enrolled in, if any?

C. What can they afford to do?

1. To what extent have adults made plans to support their interests in post high school education?

2. What is the maximum annual contribution adults feel they can make toward their interests in post high school education?

D. What are the occupational positions and interests of adults?

1. What types of jobs do adults hold?

2. To what extent do adults desire to change their occupations?

3. To what extent are adults planning to change their occupation now?

4. To what extent do adults desire further education to advance in their current occupation?

E. To what extent would adults attend further education or training if it were paid for? Not paid for?

F. To what extent do adults feel their desires to change occupations cause a need for further education?

G. What hours would adults be available for attending further education?

III. By type of institution, what programs exist within Bucks County, within commuting distance of Bucks County, and outside Bucks County to meet the post high school educational needs of Bucks County residents?

A. What is the capacity of degree granting institutions? Day school? Evening school?

B. What is the capacity of non-degree granting institutions? Day school? Evening school?

C. What are the admission requirements of degree granting institutions available to Bucks County residents? Day school? Evening school?

D. What are the admission requirements of non-degree granting institutions available to Bucks County residents? Day school? Evening school?

E. What are the tuition, living, commuting and other costs to attend degree granting institutions?

F. What are the tuition, living, commuting and other costs to attend non-degree granting institutions?

G. To what extent are they now serving Bucks County residents? Day school? Evening school?

H. To what extent are students who are now attending post high school institutions receiving financial assistance and what is the average amount?

I. What are the enrollment, admission requirements, and cost of enrollment in other post high school educational programs in Bucks County?

1. Manpower Development and Training Act programs

2. Adult and continuing education programs

3. Apprenticeship training programs

J. What trends are significant in the total enrollment of universities and colleges nationally?

K. What trends are significant in costs of attending universities and colleges nationally?

IV. What are the educational requirements to enlarge employment opportunities for residents of Bucks County?

A. What are the educational requirements for employment by major occupation and major industry in Bucks County?

B. What are the employment skills, including professional skills, which industry states are needed in Bucks County now? What changes do they expect in the future?

1. By major industry, how many jobs are currently unfilled?

2. By major occupation, how many jobs are currently unfilled?

C. What is the current employment in Bucks County?

1. By major occupation?

2. By major industry?

D. What are the characteristics of training programs provided by industries in Bucks County?

E. To what extent are tuition assistance programs available through industry in Bucks County?

F. What are the opportunities for employment in the metropolitan areas within commuting distance of Bucks County by major industry and major occupation?

G. How great is swing shift employment in Bucks County industry?

H. What does labor in Bucks County see as the future for employment opportunities in Bucks County?

1. What do labor organizations want for their members now in terms of improved education and training?

2. What changes do they expect in the future?

I. Does the Bucks County employment pattern differ significantly from the nation as a whole?

J. Does the Bucks County employment pattern differ significantly from the three surrounding SMSA's?

K. What implications do employment market analysis suggest for post high school educational programs in Bucks County; particularly for those not attending college?

L. What are the educational requirements for employment by major occupation nationally?

V. What are the major obstacles to meeting post high school educational needs of residents of Bucks County?

A. To what extent are the unmet needs due to the lack of institutional or program availability within Bucks County? Within commuting distance of Bucks County?

B. To what extent are unmet needs due to inability of residents to afford educational costs?

C. To what extent are unmet needs due to inability of residents to meet admission requirements?

VI. What are the preferred courses of action available to the County to satisfy estimated unmet post high school education needs?

A. For each major type of institution and program (including 13th and 14th year vocational-technical, community college, extension centers, and adult programs in existing high schools), what changes would be needed and could be made in?

1. Programs offered?

2. Admission requirements?

3. Tuition?

4. Location?

5. Capacity?

B. What priority rankings should be assigned to unmet needs and to courses of action available to the County?

C. For a given level of expenditure of County tax funds, what combination of available courses of action satisfies the greatest proportion of high priority, unmet needs for post high school education?

APPENDIX B

Data Collection Methods

METHOD: STUDENT SURVEY

PURPOSE: TO PROVIDE BASIC DATA ON THE ASPIRATIONS, PLANS AND FINANCIAL ABILITY OF HIGH SCHOOL SENIORS FOR POST HIGH SCHOOL EDUCATION

ADMINISTERED BY: BUCKS COUNTY GUIDANCE COUNSELORS

TO WHOM: ALL HIGH SCHOOL SENIORS (PUBLIC, PRIVATE, PAROCHIAL)

WHEN: APRIL, 1967

INFORMATION TO BE OBTAINED:

1. Name
2. Age
3. Sex
4. School District
5. Address
6. Type of post high school institution high school seniors want to attend. (Day, evening, full-time, part-time)
7. Type of post high school institution high school seniors plan or expect to attend. (Day, evening, full-time, part-time)
8. Type of educational program desired.
9. Occupational career interests.
10. Type of educational program individual plans or expects to pursue now.
11. Types of post high school education program applied for, if any.
12. If acceptance received, type of education program and location.
13. Financial plans, including work arrangements, to meet costs of planned post high school education.
14. Financial support available from parents.

15. College scholarships sought and obtained and their value as a proportion of total cost.

16. For those whose immediate plan is work only, the reason they give for not continuing their education.

17. Type of high school program completed.

18. Immediate plans of those not continuing education.

METHOD: FOLLOW-UP STUDENT SURVEY

PURPOSE: TO PROVIDE BASIC DATA ON THE ACTUAL POST HIGH SCHOOL ACTIVITY OF HIGH SCHOOL SENIORS

ADMINISTERED BY: MAIL QUESTIONNAIRE (BUCKS COUNTY)

TO WHOM: SAMPLE OF HIGH SCHOOL SENIORS OF 1966-67

WHEN: FALL OF 1968

INFORMATION TO BE OBTAINED:

1. Type and location of post high school institution actually attended.
2. Type of educational program actually pursued.
3. Occupations for those who did not continue their education beyond high school.
4. Reasons for not continuing education.
5. Means of financing post high school education activity.
6. The factor students feel played the largest role in their choice of post high school education activity.
7. Future educational plans.

INSTRUMENT: INTELLIGENCE QUOTIENT TEST, ACHIEVEMENT TESTS AND CLASS RANKING

PURPOSE: TO PROVIDE BASIC DATA ON THE ABILITY OF HIGH SCHOOL SENIORS FOR POST HIGH SCHOOL EDUCATION

COMPLETED BY: GUIDANCE COUNSELORS, FROM STUDENT RECORDS

FOR: ALL HIGH SCHOOL SENIORS

WHEN: JUNE, 1967 OR JULY, 1967

INFORMATION TO BE OBTAINED:

1. What are the I.Q.'s of high school seniors?
2. What are the achievement abilities of high school seniors?
3. What are the class rankings of high school seniors (Deciles)?

METHOD: ADULT SURVEY

PURPOSE: TO PROVIDE BASIC DATA ON THE ASPIRATIONS, PLANS AND FINANCIAL ABILITY OF ADULTS FOR POST HIGH SCHOOL EDUCATION

ADMINISTERED BY: SCHOOL DISTRICT CENSUS ENUMERATORS AND COOPERATING PERSONNEL OF EDUCATION INSTITUTIONS IN BUCKS COUNTY

TO WHOM: FIVE PERCENT SELECTED SAMPLE OF THE ADULT POPULATION AND ALL ADULTS ENROLLED IN EDUCATION PROGRAMS IN BUCKS COUNTY INSTITUTIONS

WHEN: SPRING OF 1967

INFORMATION TO BE OBTAINED:

1. Name (or code number)
2. Age
3. Sex
4. School district
5. Marital Status
6. Level of education completed
7. Type of further education desired
8. Time available for education (day, evening, etc.)
9. Educational plans, if any
10. Current education program enrollment, if any
11. Occupation (present)
12. Location of current employment
13. Occupational career desired
14. Maximum annual funds available for education
15. Availability of financial assistance from employer or veterans benefits
16. Reasons for not continuing education
17. Reasons for continuing education

METHOD: SURVEY OF POST HIGH SCHOOL INSTITUTIONS

PURPOSE: TO PROVIDE BASIC DATA ON THE TYPES OF INSTITUTIONS, PROGRAMS THEY OFFER, ENROLLMENT, ADMISSION REQUIREMENTS AND COSTS FOR ATTENDING INSTITUTIONS WITHIN BUCKS COUNTY AND WITHIN COMMUTING DISTANCE OF BUCKS COUNTY

ADMINISTERED BY: GOVERNMENT CONSULTING SERVICE BY MAIL QUESTIONNAIRE AND FOLLOW-UP INTERVIEWS WHERE NECESSARY

TO WHOM: ALL POST HIGH SCHOOL INSTITUTIONS IN BUCKS COUNTY AND WITHIN COMMUTING DISTANCE OF BUCKS COUNTY

WHEN: SPRING AND SUMMER OF 1967

INFORMATION TO BE OBTAINED:

1. Enrollment of universities and colleges, by program, within commuting distance of Bucks County, (Day, evening, part-time, full-time)

2. Enrollment and capacity of universities and colleges, by program, within Bucks County. (Day, evening, part-time, full-time)

3. Enrollment of two year colleges, by program, within commuting distance of Bucks County. (Day, evening, part-time, full-time)

4. Enrollment and capacity of two year colleges, by program, within Bucks County. (Day, evening, part-time, full-time)

5. Enrollment of vocational-technical schools beyond high school, by program, within commuting distance of Bucks County. (Day, evening, part-time, full-time)

6. Enrollment and capacity of vocational-technical schools beyond high school within Bucks County.(Day, evening, part-time, full-time)

7. Enrollment in Proprietary Business, Trade and Correspondence Schools within commuting distance of Bucks County.

8. Enrollment in Proprietary Business, Trade and Correspondence Schools within Bucks County.

9. Admission requirements of universities and colleges,within commuting distance of Bucks County.

10. Admission requirements of universities and colleges within Bucks County.

11. Admission requirements of two year colleges within commuting distance of Bucks County.

12. Admission requirements of two year colleges within Bucks County.

13. Admission requirements of vocational-technical schools beyond high school within commuting distance of Bucks County.

14. Admission requirements of vocational-technical schools beyond high school within Bucks County.

15. Admission requirements of Proprietary Business, Trade and Correspondence Schools within Bucks County.

16. Tuition, residence fee and commuting costs of colleges and universitites within commuting distance of Bucks County.

17. Tuition, residence fee and commuting costs of colleges and universitites within Bucks County.

18. Tuition fee and commuting costs of two year colleges within commuting distance of Bucks County.

19. Tuition fee and commuting costs of two year colleges within Bucks County.

20. Tuition fee and commuting costs of vocational-technical schools beyond high school within commuting distance of Bucks County.

21. Tuition fee and commuting costs of vocational-technical schools beyond high school within Bucks County.

22. Tuition fee and commuting costs of Proprietary Business, Trade and Correspondence Schools within commuting distance of Bucks County.

23. Tuition fee and commuting costs of Proprietary Business, Trade and Correspondence Schools within Bucks County.

24. Percentage of students that have applied for and received financial assistance and the average amount, at universities and colleges within commuting distance of Bucks County.

25. Percentage of students that have applied for and received financial assistance and the average amount, at universities and colleges within Bucks County.

26. Percentage of students that have applied for and received financial assistance and the average amount, at two year colleges within commuting distance of Bucks County.

27. Percentage of students that have applied for and received financial assistance and the average amount, at two year colleges within Bucks County.

METHOD: LITERATURE SURVEY AND INTERVIEWS WITH AGENCY REPRESENTATIVES

PURPOSE: TO PROVIDE BASIC DATA ON OTHER EDUCATIONAL PROGRAMS NOT DIRECTLY RELATED TO A PARTICULAR EDUCATIONAL INSTITUTION AND STATISTICAL INFORMATION ON SELECTED NATIONAL EDUCATIONAL TRENDS

ADMINISTERED BY: GOVERNMENT CONSULTING SERVICE

WHEN: SPRING AND SUMMER OF 1967

INFORMATION TO BE OBTAINED:

1. Enrollment of universities and colleges nationally. (Day, evening, part-time, full-time)
2. Tuition and residence costs of universities and colleges nationally.
3. Enrollment, by program, of Bucks County residents in Manpower Development Training Program.
4. Enrollment, by program, of Bucks County residents in Adult and Continuing Education Programs in Bucks County.
5. Enrollment of Bucks County residents in Apprenticeship Training Programs in Bucks County.
6. Admission requirements of Manpower Development Training Act programs.
7. Admission requirements of Adult and Continuing Education Programs.
8. Admission requirements of Apprenticeship Training Programs.
9. Cost of enrollment in Manpower Development Training Act Programs.
10. Cost of enrollment in Adult and Continuing Education programs.
11. Cost of enrollment in Apprenticeship Training programs.

METHOD: LABOR AND INDUSTRY SURVEY

PURPOSE: TO PROVIDE BASIC DATA ON THE EMPLOYMENT DEMAND AND REQUIREMENTS IN BUCKS COUNTY

ADMINISTERED BY: GOVERNMENT CONSULTING SERVICE THROUGH MAIL QUESTIONNAIRE AND FOLLOW-UP INTERVIEWS WHERE NECESSARY

TO WHOM: ALL EMPLOYERS IN BUCKS COUNTY WITH OVER 200 EMPLOYEES

WHEN: SPRING OF 1967

INFORMATION TO BE OBTAINED:

1. Educational requirements by major industry and occupation in Bucks County.
2. Employment skills industry states are needed now in Bucks County.
3. By major industry, the number of unfilled jobs in Bucks County.
4. By major occupation, the number of unfilled jobs in Bucks County.
5. The characteristics of education and training programs provided by Bucks County industry.
6. Availability of tuition assistance programs through industry in Bucks County.
7. Labor organization desires for improved education and training of their membership.
8. Number of employees on swing shift.

METHOD: SURVEY OF STATISTICAL LITERATURE ON EMPLOYMENT AND INDUSTRY

PURPOSE: TO PROVIDE BASIC DATA ON EMPLOYMENT CONDITIONS NATIONALLY AND WITHIN THE THREE METROPOLITAN AREAS SURROUNDING BUCKS COUNTY

ADMINISTERED BY: GOVERNMENT CONSULTING SERVICE

WHEN: SPRING OF 1967

INFORMATION TO BE OBTAINED:

1. Educational attainment of work force by major occupation nationally.

2. Current employment by major occupation and industry nationally.

3. Current employment by major occupation and industry in the three metropolitan areas surrounding Bucks County.

4. Employment forecasts, by occupation and industry, nationally.

METHOD: COMPARATIVE STATISTICAL ANALYSIS AND PROFESSIONAL INTERPRETATION

PURPOSE: TO PROVIDE COMPARATIVE ANALYSIS OF SELECTED SURVEY QUESTIONS AND ESTABLISH RELATIONSHIPS BETWEEN TRENDS NATIONALLY, IN THE THREE SMSA'S AND BUCKS COUNTY

PERFORMED BY: GOVERNMENT CONSULTING SERVICE

WHEN: SPRING AND FALL OF 1967

QUESTIONS TO BE ANSWERED:

1. For each school district how do the financial plans of high school seniors for post high school education compare with their aspirations for the same?

2. For each school district how do the financial plans of high school seniors for post high school education compare with their plans and expectations for the same?

3. For each school district how do the aspirations of high school seniors compare with expected achievement?

4. For each school district how do the abilities of high school seniors compare with their aspirations for post high school education?

5. For each school district how do the eligibilities of high school seniors compare with their aspirations for post high school education?

6. For each school district how do the abilities of high school seniors compare with their plans for post high school education?

7. For each school district how do the eligibilities of high school seniors compare with their plans for post high school education?

8. For each school district how do the aspirations of adults with a high school education compare with their plans for post high school education?

9. For each school district how do the aspirations of adults without a high school education compare with their plans for post high school education?

10. For each school district how do the financial plans of adults with a high school education compare with their aspirations for post high school education?

11. For each school district how do the financial plans of adults without a high school education compare with their aspirations for post high school education?

12. For each school district how do the financial plans of adults with a high school education compare with their plans for post high school education?

13. For each school district how do the financial plans of adults without a high school education compare with their plans for post high school education?

14. What explanations are there for the differences, if any, between what high school seniors want and plan to do?

15. What explanations are there for the differences, if any, between what high school seniors want and can afford to do?

16. What explanations are there for the differences, if any, between what high school seniors want and are eligible to do?

17. What explanations are there for the differences, if any, between what high school seniors want and have the ability to do?

18. What explanations are there for the differences, if any, between what high school seniors plan and can afford to do?

19. What explanations are there for the differences, if any, between what high school seniors plan and are eligible to do?

20. What explanations are there for the differences, if any, between what high school seniors plan and have the ability to do?

21. What explanations are there for the differences, if any, between what adults with a high school education want and what they plan to do?

22. What explanations are there for the differences, if any, between what adults without a high school education want and what they plan to do?

23. What explanations are there for the differences, if any, between what adults with a high school education want and can afford to do?

24. What explanations are there for the differences, if any, between what adults without a high school education want and can afford to do?

25. What explanations are there for the differences, if any, between what adults with a high school education plan and can afford to do?

26. What explanations are there for the differences, if any, between what adults without a high school education plan and can afford to do?

27. How did the aspirations and plans of high school seniors compare with what they actually did the fall of 1967?

28. What explanations are there for the differences, if any, between their plans and aspirations and what they actually did?

29. For high school seniors, what is the probability of successful completion of the post high school education programs wanted?

30. For high school seniors, what is the probability of successful completion of the post high school education planned for?

31. For high school seniors, what is the probability of successful completion of the post high school educational program actually entered?

32. Is Bucks County employment situation typical or atypical of the employment situation in the three surrounding SMSA's?

33. Is the Bucks County employment situation typical or atypical of the employment situation in the nation as a whole?

34. What significant differences are there between the educational needs in Bucks County and available national data on educational needs? Are the differences significant to this study?

35. What relationship should be established between I.Q., achievement test scores and class ranking in terms of need to attend different types of post high school institutions?

36. What implications do employment market analysis suggest for post high school education programs in Bucks County; particularly for those not attending college?

LIST OF THE STUDIES AND REPORTS USED AS RESOURCES
FOR THE BUCKS COUNTY POST HIGH SCHOOL STUDY

1. "Employment and Earning Statistics for States and Areas 1939-1965," by the U. S. Department of Labor, June 1966.

   This report provides employment data by industry for Philadelphia-Camden SMSA and the Allentown-Bethlehem-Easton SMSA. In both cases the data generally go back as far as 1952. The industrial classification breakdown includes non-manufacturing industries such as wholesale trade, finance, and government.

2. "Financial Statistics of Institutions of Higher Education 1959-1960," by the U. S. Department of Health, Education, and Welfare, 1964.

   Study is a comprehensive analysis of expenditures and revenues of institutions of higher education in 1960. Its importance for the study is limited primary to its analysis of student loan funds provided by the institutions of higher education in the United States.

3. "Survey of State Legislation Relating to Higher Education," by the U. S. Department of Health, Education, and Welfare, December 1963.

   This study reports information on state legislation passed during 1963 relating to higher education. The study serves as a reference device for its report on the Pennsylvania Community College Act and the Student Loan Fund Legislation.

4. "Project Talent: Studies of the American High School," by the University of Pittsburg, 1962.

   Chapter 10 and 11 of this second report of project talent may be of use to the test scores as a check against those which will be made for the high school seniors of Bucks County.

5. "Project Talent: The American High School Student"

   This study is extremely comprehensive in its coverage of the attitudes, aptitudes, and interests of high school seniors and other high school students. It becomes of use to this study in its several important classification systems dealing with educational interests, occupational interests and institutional classifications. This study also presents a wealth of information on the background plans and aspirations of American youth , college attendance by academic aptitude level, factors associated with failure to enter college, major field to study, and factors affecting American youth as they seek employment.

6. "Higher Education and the Future of Youth in the Greater St. Louis Educational Area," by the Committee on Higher Educational Needs of Metropolitan St. Louis, 1960.

This study is a comprehensive look at the higher educational needs of metropolitan St. Louis. It shows significance for the Bucks County Post High School Study in its findings on the mental abilities of high school seniors, their post high school plans and aspirations, and actual achievements in post high school education. The shortcoming of this study is found in its failure to bring together the many statistics which have been collected and analyzed into one overall analysis of their impact on the design and scope of the higher education program. The study itself is broken down into four parts dealing with (a) demographic projections; (b) an examination of collegiate capacity, (c) the post high school plans and aspirations and mental abilities of high school seniors and (d) a study of the needs of business and industry in greater St. Louis.

7. "A Long-Range Plan for the City University of New York 1961-1975"

This study is a comprehensive long-range plan for an institution, the City University of New York. The study is addressed to the questions of how many people do we expect to educate in our colleges, in what ways are we going to educate them and what facilities and how much money will be needed to do it. Perhaps of most importance to the Bucks County study Chapter 5 dealing with the problem of numbers is the forecast of total undergraduate enrollment and the procedures for estimating high school graduates. This discussion is quite extensive and bears a direct significance for the problems in forecasint student enrollment in the Bucks County study.

8. "The Regents Tentative State-Wide Plan for the Expansion and Development of Higher Education," by the Regents of the State University of New York, 1965.

The Regent's plan represents an integration of all the planning efforts of all the institutions of higher education in New York State, modified based on the views of the Regents of the State University of New York briefly describes the complex of higher education in the State of New York, the needs for higher education from the point of view of the individual in the state. and factors affecting the cost and trends in expenditures and incomes for higher education. This study is important for the Bucks Higher Education investigation in several respects. First, Part II goes some distance in attempting to define the potential and probable college attendance and enrollment by class of institution. It also attempts to define needs of the economy and society in terms of proper utilization of institutions of higher education and the four years of human resources. Part IV is significant for its analysis of per student costs for operating institutions of higher education and projection of the operating costs in capital outlays for the master plan for higher education.

9. "Higher Education in New York State," by the New York Citizens Committee for Public Higher Education, 1965.

This study was a response to a felt need for the people's views to be heard on educational matters in the State of New York. The study in Part III presents a program to strengthen the New York State University system of higher education.

10. "Toward Educational Opportunity for All," by Dorothy M. Knoell, 1966.

This study is the outgrowth of the State University of New York concern or its responsibility to serve youth to whom no appropriate opportunity for education beyond the high school now is offered. The study involves research into the realities of the feelings of the young people now without opportunity, the attitudes of board members and staff in the two year colleges, the experience of young people who try college and fail to complete programs, and the statistics of the manpower expert. An assumption of this study is that all high school graduates have some potential for further education although they may differ in their motivations. Furthermore the finding that few who seek admission to college are not now being accommodated somewhere should be no cause for complacency. The study is important for Bucks County research also from the standpoint of the discussion of the manpower situation. In this realm the study makes a very important contribution pointing out the speculation which we must make about the entirely new type of jobs which may be required in the federal great society program and elsewhere in the economy if we are clearly to understand the impact of manpower on the educational system.

11. "The Legislature and Higher Education in New York State," by the Legislature's Consultant on Higher Education, 1964.

This report is the result of the state legislature's request to have consultants to examine the activities of the State University of New York, study its master plan and make recommendations for improving the University and higher education generally in New York. In large part, the second chapter is a discussion of administrative problems of the State University of New York and the consultant's recommendations thereof. Chapter 3 is an excellent discussion of the state and the private colleges and universities, the responsibilities of each, and steps the state could take which would be helpful to all private colleges and universities. Chapter 5 carries forward this theme in discussing inter-institutional cooperation.

15. "Needs and Facilities in Higher Education in New York State," by the State Education Department of New York, 1957.

This study is a report of needs and facilities for higher education in New York State and forms a part of a series of studies authorized by the Board of Regents in 1956. Primary emphasis of the study is on the needs for higher education in terms of ability

and other social and economic characteristics of the high school graduates in New York State. Part III of the report is a discussion of the relationship between the need for post high school education and facilities available. The study concluded that approximately 16% of the high school graduates should seek technical education if adequate facilities were available. The measure for need for four year degree programs was based on the full-time undergraduate enrollment in all four year colleges which was extended in proportion to the state-wide percentage increase in high school graduates.

13. "The Regents Proposal for the Expansion and Improvement of Education in New York State," by the State Education Department of New York, 1960.

This study is significant for the Bucks County research project in its discussion of financial assistance to undergraduate students and the regent's proposal to improve the availability of funds so that high school graduates can continue higher education. The regents recommended amendments in New York law that would permit out of state study for those receiving scholarships under New York law. They also recommended that interest on loans supported under the New York Higher Education Assistance Corporation be limited to a 3% charge to the student and the remaining interest cost be carried by the state.

14. "Master Plan for the City University of New York," by the Board of Higher Education of the City of New York, 1964.

The master plan study for the City University of New York was prepared for the Board of Regents of the State as required under New York law. Most parts of this study are applicable only to the City University of New York under its own system of organization and operation, however, for the Bucks County project Chapter 7 detailed analysis of estimates of potential student enrollment in the City University of New York higher education system provide a very detailed look at the problem of enrollment projection for post high school education in all types of institutions in the City University of New York system. This study also recommends that the City University of New York place the community colleges on a tuition free basis in order the channeling of students to a senior or community college on the basis of ability and academic need.

15. "Report of Progress on a Master Plan for Higher Education in Pennsylvania,"by the State Board of Education, 1966.

The main thrust of this report on the master plan for higher education in Pennsylvania is its attempt to define the respective roles of the different educational institutions in the state and to develop a state system of higher education and allocate responsibilities to the various units within this system. The heart of this recommendation is that the community college seg-

ment of the commonwealth system replace through gradual attrition the branch campus system of the state university. This report is important also for its elaboration of the criteria under which an institution of higher education may or should become a part of the commonwealth system of higher education.

16. "Pennsylvania's State Plan for Vocational Education," by the Department of Public Instruction, 1960.

This report is a detailed statement of the administration and supervision of the state plan for vocational education involving such matters as the adoption, approval, and enforcement of a vocational educational plan, fiscal procedures and practices, and a local administration of programs for vocational education.

17. "Statiscal Report of the Superintendent of Public Instruction," by the Department of Public Instruction, 1965.

This is a detailed statistical report of educational statistics for the State of Pennsylvania including elementary and secondary education and higher education. Several charts and tables are of importance to the Bucks County project, including the holding power of secondary schools, grade enrollment in public secondary schools, grade enrollment in public secondary schools, secondary-public and non-public graduates of 1964 and the number going to college, distribution of twelfth grade public school graduates by activity as of October following graduation, the distribution of pupils in vocational education, and finally enrollments of full-time students in institutions of higher education fall 1963.

18. "New Jersey's Undergraduates 1954-1973," by the New Jersey State Department of Education, 1956.

This study was restricted to an examination of the demand and facilities for full-time undergraduate education in the next two decades. Although a study made early in 1950's, the report is significant to Bucks County in its analysis of the number of New Jersey people who will be interested in and able to attend full-time undergraduate work and the parallels they draw between this interest and the social forces at work in New Jersey such as parental education, economic forces, and the demands of a technical society. The final section makes a detailed analysis of the cost of providing this higher education based on 1950 figures although the cost indexes have changed, the methodology is significant for the Bucks Higher Education study.

19. "College Opportunity in New Jersey," by the State Board of Education, 1957.

A comprehensive look at the role of public institutions of higher education in New Jersey including junior colleges, teacher's colleges, and the state universities. The most important section, however, deals with the common problem to all studies projecting

the needs for post high school education. The New Jersey report uses the cohort population prediction, the census method, the persistence method and also examines where the past graduates have tended to go in post high school education. This definition of need is then placed against a nationwide trend for post high school education.

20. "Digest of Educational Statistics," by the U. S. Department of Health, Education, and Welfare, 1965.

The primary function of this report is to provide an abstract of statistical information covering the entire field of american education from kindergarten through graduate school. The publication continas information on the number of schools and colleges, enrollments, graduates educational attainments, finances and federal programs. Section 2 dealing with higher education is of most importance to a national picture of post high school education in the United States.

21. "Projections of Selective Educational Statistics for Pennsylvania 1975-76," by the Department of Public Instruction, 1966.

This report is a valuable statistical guide to statistics on enrollment and graduates of Pennsylvania's elementary and secondary schools and institutions of higher education.

22. "Vocational and Technical Education: A Review of Activities and Federally Aided Programs," by the Department of Health, Education, and Welfare, 1963.

This report is a review of state federal cooperative programs of vocational education in the United States. It is significant for the Bucks County research project in its analysis and description of the natioanl vocational survey carried out in 1962 and its description of the activities of the basic vocational-technical programs across the United States and the emerging trends and prospects that the data portrays. It is highly significant also for its classification of basic vocational-technical education programs.

32. "Vocational Education in the Pittsburgh Public Schools," by Donald Dauwalder, 1963.

This is a study of industries and schools in the city of Pittsburgh relating to the education and training requirements for successful job placement in the various skilled levels and types of employment available in the area. The major limitation of this study is that it would concentrate on the pre-employment training of in-school youth it would not cover the many implications of the retraining of adults except as such retraining directly related to in-school programs or equipment. It is a valuable study, however, for its comprehensive look at the student, the community, industry, and the problems of vocational-technical education and jobs.

24. "Preliminary Proposal for Bucks County Community College." by the Bucks County Board of School Directors, 1964.

The scope of the study related to the student body, program offerings, geogrphic location and patterns of financial support and sponsorship for the development of a community college system in Bucks County. Figures and tables on the population, college trends for career plans, student surveys of seniors, juniors and sophomores and follow-up information is all important to the Bucks post high school study.

25. "A College for Bucks County: A Study to Determine the Need," by Bucks County Office of Education, 1962.

The County Board of School Directors initiated and conducted a county-wide study to determine the need for a community college. A questionnaire was administered to all secondary school students in the Bucks County School System to determine student interest and evaluation by the school counselor.

26. "Pennsylvania's High School Seniors 1958," by the Joint State Government Commission, 1959.

This study was a major effort to examine the mental ability, motivation and resources of some 10,000 high school seniors in the State of Pennsylvania. These findings were to be carried forward and tested for the actual results by follow-up survey of the high school seniors of 1958 four years hence. This report along with its companion report is of extreme importance to the problems of estimating need in the Bucks County research study, particularly in terms of the mental ability, motivation and resource measurements.

27. "Four Years After High School: A Follow-Up Survey of the Pennsylvania High School Seniors of 1958," by the Joint State Government Commission, 1964.

This is the companion report to the 1959 study. The replies of 4,000 of the original 10,000 seniors of 1958 were surveyed to determine their post high school education, their employment, and their future plans and compare these replies with the expectations and mental abilities demonstrated in the 1959 study.

28. "Urban Research and Education in the New York Metropolitan Region," by Harvey Perloff and Henry Cohen, 1965.

Volume I of this report is a summary of the findings on the more effective employment of the intellectual resources of the region and coping with the problems of the New York metropolis. It provides a general educational resource for evaluating the role of education in the community.

29. "Bucks County Population Estimates for the Years 1965, 1980, and 2010," by the Bucks County Planning Commission, 1959.

A comprehensive statistical examination of population characteristics and population per se in Bucks County for the years 1965, 1980 and 2010.

30. "Urban Research and Education in the New York Metropolitan Region, Volume II," by Harvey Perloff and Henry Cohen, 1965.

This is the companion report to Volume I of the same title.

31. "A Survey of Data Sources in Delaware, New Jersey, and Pennsylvania," by Research For Better Schools, Inc., June 1966.

This survey served an important role in locating and acquiring data of all sorts for the Bucks County post high school education study.

32. "Directory of Manufacturing Plants in Bucks County Pennsylvania," by Bucks County Industrial Development Corporation, 1966.

A comprehensive listing of all manufacturing industries using the standard industrial classification and their employment for the year 1966-67.

33. "An Economic Atlas of Pennsylvania," by the Pennsylvania State Planning Board, 1964.

A comprehensive statistical analysis of certain basic patterns in employment, income, population, housing, manufacturing, and other social-economic characteristics. The figures most generally used for the Bucks County study would be those relating to manufacturing and employment.

34. "Comprehensive Plan: Bucks County Pennsylvania," by the Bucks County Planning Commission, 1961.

As most comprehensives do, this one of Bucks County provides a good resource background into the population changes, housing and industrial development, road programs, and the projection for things to come through the year 1980.

35. "Handbook of Educational Statistics for Pennsylvania Schools," by the Department of Public Instruction, 1947.

This serves as a companion report to the more recent handbook of educational statistics published by the Department of Public Instruction. This early report provides the capability of examining statistical representations over extended periods of time.

36. "How Do We Stand: Pennsylvania's Ability and Effort to Support a Better Educational Program," by the Department of Public Instruction, 1954.

This report when contrasted with Bucks County educational system as it is today, depicts a dramatic change in education. Bucks County in 1950 had only 74% of 16 and 17 year old persons in school and ranked 53rd of the counties in the state.

37. "1965 County Industry Report," by the Department of Internal Affairs, 1966.

A comprehensive group of statistics concerning employment by manufacturing industry in Bucks County for the year 1965 by a political subdivision in the county.

38. "Health, Education and Welfare Trends Part I," by the Department of Health, Education, and Welfare, 1965.

Part I of this two-part report is a comprehensive, statistical depiction of national trends in health, education and welfare. We find in the U. S. more than two-thirds of the pupils who entered the fifth grade graduated from high school in 1965 and 56% of the high school graduates will enter college in the nation as a whole. Currently there are almost five million students enrolled in institutions of higher education and approximately 4.6 million enrolled in vocational education courses. Enrollments in junior colleges is expected to climb to 1.4 million in 1974 from the current 711,000. This publication also represents a helpful reference source for the classification of fields of interest in education to high school seniors and adults.

39. "State Data and State Rankings in Health, Education and Welfare, Part II, by the U. S. Department of Health, Education, and Welfare, 1965.

Through this report we get a closer picture of the educational picture in the State of Pennsylvania. Its usefulness is limited however, in that the ranking system tells us less about the actual characteristics of the education system in Pennsylvania than some other means of statistical analysis might provide.

40. "Estimates of the Population of the United States by Age, Color and Sex, July 1, 1966," by the U. S. Department of Commerce, Bureau of the Census, 1966.

This report is a useful guide to the changes in age composition and size of the population in the United States from the 1960 Census to July 1, 1966.

41. "Area Technical School - Vocational-Technical Education Pupil Interest Survey for the School Districts of Palisades, Pennridge, and Quakertown," by the Bucks County Public Schools.

This report is a summary of the findings of the interests of pupils in grades i, 9, 10, and 11 in their respective school districts of their interets in vocational-technical education and the

establishment of an area technical school. The survey questions were also administered to parents of the students and their responses are included.

42. "Central Bucks County Area Technical School, Vocational-Technical Education Pupil Interest Survey for the School District of New Hope-Solebury, Council Rock, Centennial, Central Bucks," by the Bucks County Public Schools.

This report is similar to the one previously mentioned and shows basically the same information on pupil and adult interest in area vocational-technical education.

43. "Statistics for Manufacturing Industries in Pennsylvania 1965," by the Department of Internal Affairs, November 1966.

This is a summarized statistical description of manufacturing establishments, employment, and production values by county, by industry for Pennsylvania during 1965.

44. "Health Manpower", in the Employment Service Review, by the U. S. Department of Labor, November 1966.

All of the articles in this review concerned themselves with the challenge of health manpower in the years to come. As one aspect of the social service employment market these articles provide a telescopic view of one of the more important changes occurring in the demand for employee skills.

45. "Mobility of the Population of the United States, March 1965 to March 1966," in Current Population Reports, by the U. S. Department of Commerce, Bureau of the Census, 1966.

These statistics provide a comprehensive look at the moving American, the rate at which he moves and the distance which he moves and the changing characteristics of mobility.

46. "An Analysis and Summarization of Data as Reported by Pennsylvania's Institutions of Higher Education," by the Department of Public Instruction, 1965.

This is one of a series of reports by the Department of Public Instruction concerning Pennsylvania's institutions of higher education. This particular report deals with student costs, faculty salaries, degree status of faculties, and enrollment trends and Part II deals with financial data. Enrollment data in institutions of higher education is categorized for the fall term of 1963.

47. "Bachelors and Higher Degrees Conferred by Pennsylvania's Institutions of Higher Education between July 1, 1964 and June 30, 1965," by the Department of Public Instruction, 1965.

This statistical summary is significant for its classification of degrees granted by institutions of higher education.

48. "Student Costs, Faculty Salaries, and Degree Status of Faculty," by the Department of Public Instruction, 1966.

The statistical tables are concerned with tuition, fee charges and room and board costs for institutions of higher education for the fall term of 1965-66. They also show comparisons with the year 1964-65 and the changes in their respective costs.

49. "Financial Statistics of Pennsylvania's Institutions of Higher Education, 1964-1965," by the Department of Public Instruction, 1966.

This statistical summary is of limited use for the Bucks County research project with the exception of its analysis of the National Defense Student loans for the State of Pennsylvania in 1964-65.

50. "1965 Summer Session and Fall Enrollment Data Reported by Pennsylvania's Institutions of Higher Education," by the Department of Public Instruction, 1966.

These statistical tables highlight the applications processed for admission to the freshman class, the percentage of applicants accepted by the institution, the enrollments in all categories in higher education and the role of the junior college and community college in handling full-time enrollment in higher education.

51. "Statistics on Pennsylvania's Non-Public Secondary Schools, 1965-66," by the Department of Public Instruction, 1966.

The statistical tables are important to Bucks County's research project only in terms of the grade enrollment by county and the distribution of graduates by post high school activity and county.

52. "Summarization of Data Reported by Pennsylvania's Institutions of Higher Education," by the Department of Public Instruction, 1963.

This is a summary of statistics for institutions of higher education during the school year 1961-62. The same information provided in this report is provided in the more recent report for 1966. With the complete series of reports there is provided an opportunity to see the institutions of higher education through a time series outlook.

53. "Typical Programs of Instruction Offered by Pennsylvania's Community Colleges," by the Department of Public Instruction, 1966.

This is a one page classification of programs in the terminal, or transfer and transfer programs of community colleges in Pennsylvania.

54. "Educational Attainment of Workers, " by the U. S. Department of Labor, 1965.

This report is perhaps one of the only reports available on the education or school years completed of employed persons by occupation, establishing some criteria for a relationship between occupation and educational achievement. Its drawbacks or restrictions are primarily in terms of the participation of only a section of the country and the particular section of the country which did participate in the study.

55. "The Private Business School Act," by the Department of Public Instruction, State Board of Private Business Schools.

This paper is a description of the requirements and definitions and licensing processes for the establishment of private business schools in Pennsylvania.

56. "Rules, Regulations, and Standards of Instruction Governing Private Trade Schools, Classes and Agents," by the State Board of Private Trade School Act.

57. "Guide for Officials of Training Facilities, Manpower Development and Training Act," by the Bureau of Employment Security, December 1965.

This document is an explanation of the responsibilities of officials involved in the manpower development and training act concerning the allowances provided under the act, the responsibility for training facilities, and the completion of different manpower development training act forms by the trainee and the training facility.

58. "The Pennsylvania Approach to Manpower Training," by the Department of Public Instruction, 1964.

This is a very small brochure designed to acquaint people at a quick glance with the highlights of the manpower development and training project and program.

59. "New Directions for Vocational Education," by Gerald B. Leighbody, 1966.

This paper is an examination of curriculum development and vocational education examing the directions, dimension, and speed of significant occupational trends. The basic point in this paper is that it is one of the first and clearest implications of the new technology and shows the need for all workers to have higher levels of basic education. The most valuable vocational training that can be provided is the basic general education program which has not previously been identified as vocational education. In other words, it seems likely that both the needs of society and the occupational adjustments of individuals will

be better served if specific vocational training is provided at the latest possible period in the educational career of the individual. Mr. Leighbody also points out that the drop-out rate for vocational courses is often considerably greater than for general academic programs. The conclusion reached from this experience is not favorable to the idea that the opportunity to leave the academic track and concentrate on vocational courses will so motivate potential dropouts that they will remain in school.

60. "Total Civilian Work Force, Unemployment and Employment by Industry: Annual Average, 1960-1965 Philadelphia Labor Market Area," by the Bureau of Employment Security, 1966.

This document contains an accounting of employment by industry for all manufacturing and non-manufacturing industries as well as farm and non-farm employment for the years 1960 to 1965.

61. "Insured Unemployed in the Philadelphia and Pittsburgh Labor Market Areas, " by the Department of Labor and Industry, 1966.

This study is primarily of interest in terms of its analysis of the educational attainment of insured unemployed in Philadelphia, Pittsburgh and the State of Pennsylvania.

60. "The Insured Unemployed in Pennsylvania and in the Philadelphia and Pittsburgh Labor Market Areas, by Education and Occupation," by the Department of Labor and Industry, 1965.

This report is of interest for its examination of the educational attainment of the insured unemploued in Pennsylvnia, the Pennsylvania portion of the Philadelphia Labor Market Area and the Pittsburgh Labor Market Area.

63. "Manpower Skill Requirements and Training Needs: The Philadelphia Labor Market Area," by the Department of Labor and Industry, 1962.

This report is a study of labor supply and demand in eighty types of occupations projected in 1967 for the Pennsylvania portion of the Philadelphia Labor Market Area. The data in this study are based on information obtained from almost 2,000 employers and over 130 schools in the five county Philadelphia area.

64. "Microanalysis of Socioeconomics Systems: A Simulation Study," by Orcutt, Greenberger, Korbel, and Rivlin, 1961.

This volume explores microanalysis and simulation of the United States socioeconomic system. The approach taken in this volume is that it appears reasonable to expect that our predictions might be more successful if they were based on knowledge about the elemental decision-making units, how they behave and how they responded to the changes in their situations and how they interact, rather than examining socioeconomic aggregates.

With this approach the authors have examined ammy of the basic elemental units one of which includes education. The authors devote considerable discussion to methods of enrollment projection for higher education as a part of the simulation model of the socioeconomic system.

65. "Education Beyond the High School," by the Educational Coordinating Council, 1966.

This study represents the comprehensive treatment of formal and informal educational resources in the State of Oregon and sets forth a philosophy concerning the type of educational system required to serve the diverse potential of the individuals in Oregon. The study parallels in many respects the efforts of the Bucks County study covering community colleges, higher education, continuing education, proprietary schools, Apprenticeship programs and vocational-technical education. It is also significant for its treatment of enrollment data which is broken down by state system institutions, independent colleges and community colleges. Comprehensive reporting is covered on the matters of student financial aid and the plans and actual post high school activity of high school students in Oregon.

66. "A Study of Kingsboro Community College," by Ralph Fields and Walter E. Sindlinger and Associates, 1966.

This is an analysis of the economic, social, occupational, and educational conditions and trends in Brooklyn and implications of these for enrollments programs and services of the community college. The types of data which were searched, collected and interpreted included population facts and trends, industry and business conditions, transportation facilities, occupation trends, existing higher educational facilities and existing projections of high school enrollments.

67. "Citizen Survey of Washtenaw County Community College Possibilities," by the University of Michigan, 1963

This citizen survey was an institutionally oriented study toward the possibilities of a community college and covered such types of data as the study of high school seniors, of recent high school graduates, of the educational needs of industry and business, and the history and social characteristics of Washtenaw County. The report also made a detailed analysis of the financial aspects of establishing a community college.

68. "A Study of Higher Education in the Mohawk Valley Area," by Dr. Michael Brick, 1965.

The area of focus in this study is the Utica-Rome metropolitan area. The study team examined the economic and demographic characteristics of the area, the future college enrollments taking into account available facilities, the amount and nature of educational

needs and the clues to interest, willingness, and desire of the people to support the four post high school education. It is limited, however, in that it made no attempt at occupational survey and no attempt to recommend specific educational programs.

69. "Higher Education in the Future of Youth in the Greater Philadelphia Area," by the Committee on Higher Educational Opportunity in Philadelphia, 1957.

This report is a combination of several reports which were handled on a specialized basis to examine the needs and resources and demands for higher education in the Philadelphia metropolitan area. Basically, the study was broken down into five parts: (1) dealing with demographic projections until 1975, (2) dealing with the examination of college capacity in the greater Philadelphia area, (3) dealing with the post high school plans of students in the greater Philadelphia area, (4) other types of post high school opportunities in the greater Philadelphia area, and (5) the special survey of educational or vocaional plans questionnaire. Very importantly, they found that unless a student ranked in the upper two-fifths of his class, he had very little opportunity for college education in the Philadelphia area.

70. "The Organization of the State Colleges within the Commonwealth of Pennsylvania," by Earl J. McGrath, 1965.

This study focuses on the defects and limitations in the organization and administration of the state colleges which would prevent them from achieving their major purposes. He recommends the establishment of a State Board of Higher Education charged with the responsibility of managing all the publicly financed higher education. He also recommended, the establishment of a secretariat that would be responsible for research and planning, fiscal management, program development and personnel improvement. This arrangement would replace the existing Board of Presidents of the state colleges.

71. "Continuing Professional Educational Needs of Engineers in the Philadelphia Area," by the Pennsylvania State University, 1965.

This is a comprehensive examination of the demands and needs for continuing professional educational engineers in the Philadelphia area and Pennsylvania. The study was concerned with the development of exponentail growth of knowledge in the obsolescence of engineers. It was specifically restricted to determining the continuing professional education needs of engineers who have been out of college five or more years. There was a sample of 2,090 engineers drawn from twenty-three industrial and government groups.

72. "An Investigation of Location Factors Influencing the Economy of the Philadelphia Region," by the Regional Science Research Institute, 1966.

This report is helpful to the Bucks County Post High school Education Research study in its analysis of the presently or potentially important manufacturing industries for Philadelphia and the labor market demand which they will create. They recommend that the technical programs of community colleges should be expanded and strengthened to help alleviate the shortages of technicians, draftsmen and other craftsmen who are so necessary to the small volumes of special production industry which represent potential industrial growth for the Philadelphia area. The study points out that manufacturing location decisions are becoming more dependent on non-economic or amenity factors such as educational institutions.

73. "How Institutions of Higher Education Contribute to the General Economic, Social, and Cultural Betterment of Greater Philadelphia."

The study presents a theory of economic productivity of higher education in an effort to identify the tangible services and contributions to the general economic, social and cultural betterment of greater Philadelphia by the degree granting institutions located in southeastern Pennsylvania. The report states that the rate of return on investments in education whether calculated on full cost or merely on private cost, today exceed the rates of return for most investments in physical capital.

74. "Elements of a Master Plan for Higher Education in Pennsylvania," by the Academy for Educational Development, Inc., 1965.

This report sets forth recommendations on what might be included in the commonwealth's master plan for higher education. It is primarily useful for the broad goals and objectives recommended for governing higher education in Pennsylvania and the role of the various types of institutions in higher education as seen by the consultant. The report also examine continuing education, technical education, cooperative education, and other phases of the entire post high school educational program in the state.

75. "The Administration and Financing of Vocational-Technical Education in Pennsylvania," by Donald D. Dauwalder and Associates, 1965.

This report examines the vocational-technical offerings which are available in each of the 67 counties of the commonwealth. It examines the changes from 1950 through 1963 for each of the major statistical areas for the major employment groupings from which the U. S. Department of Labor maintains monthly reports. The report concludes that all of the factors which are analyzed and discussed in relationship to employment vary so materially between statistical areas and between counties, that local determinations of all factors are required before any county plans the specific types of levels of vocational-technical education which should be offered in the district or county. The report is sig-

nificant also for its analysis and recommendations on the organization of vocational-technical education in the state and the weaknesses which are existing in the organization and planning of high school programs, variable technical school programs, technical institutes and community colleges.

76. "A Master Plan for Higher Education in California, 1960-1975," by the Regents of The University of California and the State Board of Education, 1960.

This report dealt with four basic questions. First what is the size of the student enrollent in higher education to be served by 1975? Second, what should be the appropriate differentiation of functions among the institutions of higher education? Third, what is the estimated cost to the state for providing this public higher education? Fourth, what is California's ability to pay for the future development of public higher education? The particular usefulness to the Bucks County higher education study are the two chapters which deal with student enrollment potentials and the problems of fitting them into the educational system through such policies as restrictive admissions.

77. "Education Beyond High School - The Two-Year Community College," by the Committee to Study Community Colleges and Technical Institutes, 1961.

The New Jersey study of the feasibility of establishing a two-year community college provides an interesting treatment of economic conditions and technical needs in New Jersey and a survey of the attitudes of business and commerce with respect to continuing education. The study also contains a wealth of information on the survey of post high school seniors and juniors throughout the State of New Jersey.

78. "Community Colleges in Pennsylvania," by Ralph R. Fields and Associates, 1965.

The study employs several different treatments of demographic data felt essential to the study of community college possibilities. The study outlines programs of the most feasible community colleges and recommends policies for the coordination and interrelationships of community colleges, technical institutes, and area vocational-technical schools. Of particular interest, is the analysis of admission to bachelor degree programs and the relationship between high school rank or class rank and scores on the scholastic aptitude examination in commonwealth campuses. The report shows a cross-tabulation of acceptable scholstic aptitude scores depending on the individual's rank in his high school class.

79. "A Report to the Commission on Higher Education," by the Committee on Post High School Facilities and Programs, 1961.

This is a study in depth of the supply, demand and relationships in higher education in the City of Philadelphia, to determine whether or not Philadelphia is in need of a two-year college. The study is useful in its detailed comments on the components of supply and demand for higher education in and around the City of Philadelphia. It also could serve as a check against other projections of higher education demand and supply in the state of Pennsylvania. Table 4 in the report also provides two projections of college age population by county for southeastern Pennsylvania and projections for 18, 19, 20, and 21 year olds. Also of importance is Table 12 describing expenses and scholarship aid in Philadelphia area colleges in 1960. This report provides an analysis of important use to the Bucks Higher Education study in describing the relationship of educational achievement and employment for the nation as a whole and the considerations this brings to bear on the relationship between education and employment. This report is also useful for its interesting insights into other possible data types and their sources.

APPENDIX D

Phases II and III - Study Procedure

Definitions: Identifying Post High School Education Needs of Bucks County Residents

The first two study objectives, to estimate present and future needs for education and to estimate rexouces available to meet the needs, require some "operational" definitions if the estimates are to be quantitative.

Population: - Two groups of people will constitute the basis of analysis - high school seniors in all Bucks County public, parochial and private high schools; and all adults 16 and over residing in Bucks County who are not currently enrolled as a high school student. The adult class is intended to include high school dropouts and people taking adult education classes leading to a high school diploma.

Post High School Education: - This study will be concerned with formal education courses offered at all public and some private institutions for the general public. It will include the traditional colleges - 2 and 4 year - as well as manpower training programs, evening adult classes at public schools and other vocational-technical training public institutions. It will include private trade schools offering training for specific jobs.

Theoretical Need for Education: - For purposes of this study, every individual will be asumed to have a theoretical need for as much formal education as he is capable of completing. The amount and type of education most appropriate for each high school senior will be measured by I.Q. scores and achievement test results. A relationship will be established to permit allocation of individuals to a particular type of post high school education; however, the study staff realizes the presumptuousness of this action - hence the final tabulation of "theoretical need" will be used only as a very general guide in those cases where educational resources exceed persons interested. Then, the difference between "theoretical need" and persons interested ("recognized need") will be taken as a tentative indication of an unmet need in information - dissemination or counseling. Since data on I.Q. or achievement test

scores will not be available for adults, the study cannot estimate theoretical educational needs for adults from the data.

Recognized Need for Education: - The study will assume that any senior or adult who expresses a desire for further education has a "recognized need" for that education; however, the expressed desires (in terms of amount and type) of seniors will be compared with estimated capability to check realism of aspirations. Allocation of people to a particular type of education will still be based on desires, even though they would seem unrealistic.

Satisfied Need for Education: - Seniors who have definite plans for further education and all person actually enrolled in post high school education classes will be said to be in process of satisfying their need for education. Analysis of this group will concentrate on the location of the school and source of funds.

Capacity of Educational Resources: - The capacity of each educational institution will be expressed in terms of entering fulltime equivalent students (i. e., freshman class enrollment) in both day and evening programs. It is expected that each type of program will have separate capacity estimates.

Unmet Need for Education: - The positive difference between "recognized need" and "capacity" (once "satisfied needs" have been accounted for) for a particular program within a specific geographic area, will be called the unmet needs of that area.

Phase II: Analysis of Present Situation

Analysis will emphasize recognized needs, comparing them with both theoretical and satisfied needs. Regardless of what each person should do for further education, this study is primarily concerned with what they are likely to do, once they at least feel they should have further education.

Where possible, analyses will be made for each school district separately. Commuting areas will be defined by designating which surrounding school districts and outlying areas can be easily reached from a given point.

Figure 1. illustrates the procedure for analysis of the present situation. Projections through 1980 will use the same procedure with different data for each future year. (Note that interactions are not being considered. The presence of a post high school education facility may inspire people to want its programs, because they know it's there; also, industries may be attracted to areas with post high school education facilities near-by and thus bring in a rather different type of employee group. However, analysis of how population characteristics may be affected by changes in institutional program offerings is beyond the scope of this study, and will be compensated for by periodic updating of the study.)

There are five main steps in the analysis of the present situation:

1. Estimate relevant characteristics of each group via tests, sample surveys and other available data.

2. Translate this information into estimates of maximum "theoretical" demand of Bucks County residents on post high school education institutions (regardless of locations, costs or type of program) by allocating all seniors to some type of post high school education program according to capability.

3. Estimate maximum "recognized" demand of Bucks County residents for Bucks County area post high school educational programs (regardless of location, costs or type of institutions now within the Bucks County area) by:

   - allocating seniors to a work and/or education "destination: in the next time period according to their expressed desires and/or plans.

   - allocating adults to a work and/or education "destination: in the next time period according to their interest in further education and extent of employer support.

4. Estimate present unmet needs in general categories of post high school education program by matching existing institutions in the Bucks County area with the recognized demands from step 3. (This will also show estimates

FIGURE 1: DIAGRAM OF STUDY PROCEDURE - ANALYSIS OF PRESENT SITUATION

Bucks County PHSE
1/18/67

of satisfied needs, by type of post high school education.) Matching will involve:

- for seniors

  . money available for post high school education vs. money required for nearest institution offering desired program

  . capability vs. admission requirements

  . whether institution with desired program exists in commuting area and/or has enough enrollment capacity

- for adults

  . interest in particular programs vs. availability of desired program within commuting distance and at time desired (day or night)

  . eligibility for desired program vs. admission requirements

  . extent of employer support

5. Construct tables to show whether estimated unmet needs arise from:

   - no institutions available with desired program;

   - institution available but too far away, cost too much, desired program at wrong time of day or not enough capacity;

   - other reasons based on failure to match "recognized needs" with existing institutional situation.

Other comparisons will be made to show differences among maximum theoretical needs, recognized needs and existing capacities.

Analysis of the educational needs in future years will be done using the same method shown in Figure 1, except that projections of population, job-education requirements and institutional data will be needed to replace the surveys and questionnaires.

Existing population predictions for Bucks County will be employed to prepare high and low estimates of future numbers of high school seniors and adults. Stable distributions of each group into the

characteristics categories will be assumed, unless there is evidence of trends - for example, if a larger percentage of seniors is likely to require more education in 1980 than in 1968. Where appropriate, present trends toward more education will be incorporated to the extent they can be quantified. Projections of future institutional data will be based on their plans for expansion and change.

The projections will be processed and analysed using a computer "model" composed of three parts. (Figure 2.)

1. Estimating population characteristics - input will be total population projection, year by year, by school district; output will be estimates of the number of people in each group with each set of characteristics, year by year, by school district.

2. Estimating theoretical and recognized needs - input will be the output of 1.; output will be estimates of maximum theoretical demand and maximum recognized demand of Bucks County residents for post high school education, by type of program, year by year, by resident school district.

3. Estimating unmet needs - input will be parts of output from both parts 1 and 2, and institutional estimates; output will be estimates of numbers of people recognizing need for post high school education who will not actually be enrolled, by type of program, year by year, by school district.

It should be noted that the computer model will provide a means of updating this study in the future. By correcting projections to actual values and correcting institutional changes, a revised calculation of unmet need and a new set of projections can be produced fairly easily.

Phase III: Selecting Bucks County Preferred Courses of Action

Figure 3, the "Diagram of Procedure for Developing and Selecting Courses of Action" briefly outlines the method for using the analysis of

FIGURE 2: DIAGRAM OF PROJECTION PROCEDURE BY COMPUTER

Bucks County PHSE - 1/18/67

FIGURE 3: DIAGRAM OF PROCEDURE FOR DEVELOPING AND SELECTING COURSES OF ACTION

the present situation and projections, to arrive at a single set of recommendations - called here a "Policy Plan" - designed to satisfy as efficiently as possible the most important post high school educational needs of Bucks County residents.

It should be emphasized that extensive participation of the council is essential, particularly in constructing priority classes, in establishing priorities, in selecting the most appropriate corrective actions, in developing alternate policy plans and in determining financing methods.

Although Figure 3 shows a sequential, step-by-step approach, it should be understood that parts of the procedure may be repeated several times. For example, while developing and costing out one or more policy plans from previously evaluated corrective actions, it may become apparent that other corrective actions may be better; more combinations of actions will then be formulated and evaluated, leading to other policy plans. The effects of particular courses of action, in terms of changes in unmet needs (shown on computer output), can be related to estimated costs to get a "cost-benefit" analysis of the different possible corrective actions and policy plans. Note that the use of a computer-oriented model of the Bucks County post high school education situation permits answering many different kinds of "what-if" questions at any time during the later stages of the study. This should prove extremely helpful as long as the "what-if" questions are stated in terms of changes in relevant variables, so the results will be meaningful.

Pub Date - 65 14p.

*EDUCATIONAL EQUIPMENT; *HOME APPLIANCES; *HOME ECONOMICS EDUCATION; OCCUPATIONAL HOME ECONOMICS; HOMEMAKING EDUCATION

The bulletin was developed to assist teachers in making recommendations for additional equipment which may be purchased under the provisions of the Vocational Education Act of 1963. The equipment recommended for occupational courses involving home economics skills and knowledge is comparable to the type used in a working situation, thereby enabling the student to be better prepared for the labor market. Obtaining the recommended equipment affords opportunities for students to choose, use, and care for a variety of home equipment on the market today. Equipment for the home economics program is classified according to the instructional areas: clothing, home safety, family health, home care of the sick, grooming, and foods and nutrition. Additional equipment needed for occupational training courses is listed under food service, and housekeeping. Miscellaneous and audiovisual equipment are included. Among items included in housekeeper training are a pewter pitcher, a silver tray, and a brass ash tray. An unconnected telephone is also suggested for teaching etiquette. (FP)

FOREWARD

This bulletin has been developed by the Home Economics staff as a supplement to the publication, "The Home Economics Department--Its Equipment and Furnishings," to assist teachers in making recommendations for additional equipment which may be purchased under the provisions of the Vocational Education Act of 1963.

The Equipment recommended for home economics departments serves a twofold purpose:

> The use of the equipment in the development of skills in a learning situation comparable to the homes in the community
>
> and
>
> The development of some understanding of the problems affecting the consumer in the choice, use and care of the variety of home equipment on the market today.

The equipment recommended for occupational courses involving home economics skills and knowledge is comparable to the type used in a working situation, thereby enabling the student to be better prepared for the labor market.

It is for these multiple purposes that the recommendations on the attached pages are made in order that departments be well equipped for education in family living and occupational training.

Catherine T. Dennis
State Supervisor Home Economics Education

THE HOME ECONOMICS DEPARTMENT

If one picture is worth a thousand words, consider the "picture" our equipment gives of the home economics program. Does it bespeak a well-rounded curriculum, with provision for learning experiences in many areas of homemaking? Or does the presence of many unit kitchens, sewing machines and tables condition students, their parents and the general public in the belief that home economics activities are limited primarily to simple experiences in cooking and sewing?

It is the purpose of this supplementary list of equipment to encourage the purchase, use and care of up-to-date equipment. This list has been developed to assist the teacher in the use of creative teaching methods based on the need of the student to learn the broader responsibilities of management and consumer education.

Home Economics teachers and school administrators are encouraged to select a broad variety of equipment which will provide a teaching-learning situation for skill development and decision making on the selection, use and care of equipment and furnishings in the various areas of homemaking. Some criteria for determining department equipment needs and purchases are--

- Amount, kind, use and condition of existing equipment
- Kinds of courses to be offered and the equipment needed for a good teaching-learning situation
- Amount of funds available for equipment purchases
- Methods of teaching for knowledge and skill development
- Size of classes
- Space available in the department for use and storage

EQUIPMENT FOR HOME ECONOMICS PROGRAM

Equipment for Instructional Areas in Basic Home Economics Courses

Course Nos. 711.1, 711.2, 712, 713, 715.1, 715.2, 715.3, 716.1, 716.2, and 717

Clothing

Ironing board (adjustable steel)
Ironing board cover (metallic and ducking)
Ironing board pad
Pounding block
Sleeve board
Pressing mit
Pressing ham
Sleeve roll
Sewing machine (standard electric and deluxe)
Sewing machine attachments
Buttonhole attachment
Magnifier (hand lens)
Irons
  Steam-dry
  Steam-spray-dry
Cord minder
Iron rest
Clothes brush
Clothes delinter
Point presser combination
Tailor tack marker
Shell pattern (assorted sizes)
Buttonhole cover set

Scissors and shears:
  Buttonhole
  Scissors (5")
  Dressmaker shears (7")
  Pinking shears (7½)
Cutting board (folding)
Tracing paper
Tracing wheel
Ruler (plastic edge)
Tape measure
Point turner
Eyelet awl
Pleat maker
Gripper snap fastener
Belt maker
Seam ripper
Metal gauge
Tailor's square
Hem marker
Tailor's chalk
Dressmaker pins
Bobbins
Sewing machine needles (14-16)

Home Safety, Family Health and Home Care of the Sick

Roll-away bed
Bathroom scales
First Aid kit
Sheets
Pillow cases
Mattress cover
Blanket
Pillow
Bath towels
Hand towels
Washcloths
Oral Thermometer
Bedpan
Ice cap
Hot water bottle
Washbasin (plastic)
Sink basin (plastic)
Bucket (plastic)
Rubberized sheet

Grooming

Hair brush
Cuticle snipper
Orange stick
Cuticle pusher
Brush, nail
Comb
Tweezers
Portable hair dryer

MISCELLANEOUS PREPARATION AND SERVING EQUIPMENT

Foods and Nutrition

Major Appliances

- Range (gas or electric)
- Refrigerator
- Freezer
- Dishwasher
- Washing machine
- Clothes dryer
- Disposer

Small Appliances (Electric)

- Fry pan (12")
- Waffle-grill combination
- Can opener
- Perculator
- Toaster
- Mixer (standard and portable)
- Blender (2 speed)
- Ice cream freezer
- Cooker-server
- Knife and scissors sharpener

Miscellaneous Preparation and Serving Equipment

- Serving cart (portable)
- Clothes dryer (collapsible)
- Step stool
- Charcoal grill
- Scoops (set of 4)
- Spatula
- Salad bowls

Knives
- Boning
- Paring
- Handy
- Bread
- Slicer 10"
- Slicer (small)
- Cooks
- Grapefruit
- Corer-parer

Flour sifter
Rubber scraper
Cooling rack
Ricer
Dish towels
Dishcloths
Custard cups
Pressure saucepans
Covered casserole with lock handle (1 qt.)
Measure (1 qt.)
Measuring cups (set of 4 - dry)
Canister set (plastic - stainless steel)
Colander (3 qt.)
Can opener (manual)
Egg beater
Salt and pepper shakers

Spoons

- Solid
- Pierced
- Slotted
- Nylon
- Wooden (10" and 12")

Ice cream freezer
Ice cream scoop
Hot water canner
Kitchen scales (25 lb.)
Rolling pin (12")
Theremometer:
- Oven
- Meat
- Candy
- Deep fat

Cookie gun
Cookie press
Cake decorator gun
Mixing bowls (set of 4, glass and stainless steel)
Mixing bowl (5½ qt.)
Pie server
Sandwich spreader
Tongs (9")
Butter cutter (1/4 lb.)
Bread basket
Turner
Onion chopper
Pastry board
Long handled fork
Grater - 1 side
Cookie sheet
Dish drainer
Drain mat

Biscuit cutter
Trivet
Vegetable brush
Potato masher
Pie pan (glass and aluminum)
Cake pans (sqiare)
Saucepan (1-½ qt.)
Salad mold (6 cup)
Colander (5 qt.)
Strainer (1 qt.)
Tea strairer
Melon scoop
Nutcracker set
Jelly mold (set of 4)
Pastry brush
Tube cake pan
Muffin pan (12 cup - 6 cup)
Corn stick pan (cast iron)
Fry pan (10" - 8" - 6")
Fry pan (cast iron with cover)
Refrigerator dishes (set of 4)
Cake storer or carrier
Pastry blender
Ladle (solid)
Dutch oven (aluminum and cast iron)
Saucepan with cover (3/4, 1, 1-1/2 qt.)
Loaf pan
Double boiler (glass and aluminum)
Vacuum coffee maker
Tea pot (6 cups)
Juice extractor
Skewers (set of 4 - 16½")
Punch bowl with stand
Punch ladle
Punch cups
Trash container

CHINAWARE (Plastic, china, pottery)

Plates

- Dinner
- Salad
- Bread and butter

Cups
Saucers
Cream and sugar

Cereal bowls
Vegetable dishes

- Open
- Covered

Platter

FLATWARE (Stainless Steel)

Dinner knives
Dinner forks
Salad forks
Teaspoons
Iced teaspoons
Dessert spoons
Tablespoons

Grapefruit spoons
Butter spreaders
Butter knives
Sugar shells
Meat forks
Pickle forks
Cocktail forks
Lemon forks

GLASSWARE

Serving trays
Dessert plates (8")
Iced tea glasses
Water glasses
Sherbets

Water pitcher
Parfait glasses
Footed compotes
Low compotes
Coasters
Relish dishes

ADDITIONAL EQUIPMENT NEEDED IN A DEPARTMENT

Light meter
Demonstration mirror
All purpose table with track (60" L, 42" W, 29" H)
Tote tray guides

Vacuum cleaner
Broom (lightweight)
Floor waxer
Mops

Dust mop (long and short handled)
Wet mop (long and short handled)

Dust pan (long and short handled)
Tool box
Set of screwdrivers
Heavy screwdriver
Hammer

Claw
Tack
Upholstery

Saw
Pliers
Level (24")

OCCUPATIONAL TRAINING COURSES

The occupational courses will be taught in the home economics department, using existing facilities, with exception of training for the Child Care Aide - Course No. 714.5. The well equipped basic home economics department will provide much of the equipment needed. However, there are additional equipment items necessary in order that a more creditable training job may be done in specific areas of Food Service, Clothing and phases of Housekeeping.

Occupational courses are planned to prepare students at the high school level (students ages 17 and 18), to enter the labor market immediately upon graduation. These courses will provide learning experiences, observations and on the job training for the development of home economics knowledge and skills in specific occupations. It is necessary to plan these courses so that a student is ready to enter the labor market for gainful employment.

Additional Equipment Recommended for Vocational Education Programs

Course Nos. 714.1, 714.2, 714.3, 714.4, 714.5, 714.6, 714.7, 714.8

Food Service

Gray rack (with or without shelf)
Trays
- Rectangular - plain
- Rectangular - cork bottom
- Round - plain (14")
- Round - cork bottom
- Ticket (6-1/2")
- Large oval (24½" x 19½")

Pressure cooker (canner)
Scales portion
Pressure cooker - 4 qt.
Griddle, electric
Cooker-server, electric
Deep fat fryer, electric
Toaster, automatic 4 slice
Dripolator urn

Set up stand
Relish caddy with ladles
Hot plate - 1 unit or
Hot plate - 2 unit
Coffee warmer - Pyrex
Coffee warmer - S/S
Fry pan - Heavy cast iron with cover
Ice bucket (3 qt.)
Slicing knife, with fork, electric
Warming tray, electric

Baker's brush
Meat cleaver
Kitchen fork - two tine
Service plates
Cocktail compote
Cocktail ring and insert
Finger bowls
Table pad (dining)
Tablecloth (54" x 54")
Napkins

Clothing

Adjustable dress form and stand
Heavy duty machine
5 - way pressing board
Portable sewing machine
Pouf iron
Needle board
Monogram attachment

Zig-Zag attachment
Hem marker
Sewing and knitting gauge
Embroidery scissors
Silk pins
Emery

Housekeeping

Window cleaner (12" squeegie)
Carpet sweeper
Wax applicator
Silver tray
Pewter pitcher
Brass ash tray
Hand-type vacuum and attachments

Rubber bath mat
Laundry cart
Laundry basket
Broom, electric
Floor washer, electric
Washer-dryer combination
Telephone (for etiquette) not connected

COMBINED AUDIO-VISUAL LIST FOR ALL VOCATIONAL SECTIONS

Overhead projector
Screen projection 70" x 70" tripod - matte white
Tape recorder
Record player
Projection stand
Projection stand (mobile cabinet)
16 mm sound projector
Filmstrip projector (remote control)
Auto-slide projector
Combination wet-dry process type - Diazo (name brand)
Lettering set
Opaque projector
Typewriter
Typewriter table

AMERICAN INDUSTRY PROJECT

The nature of industrial arts emphasizes the learning of specific processes and techniques as an avenue to prevocational training and the development of a knowledge of industry. This rationale has encountered increasing problems in accounting for the contemporary state of industry. The evolving program of American Industry is based on the approach that concentration upon acquiring concepts, through encounter with specific situations, enhances the possibility of retention, transfer, and application of knowledge to new and different situations. The first-level course in the program, designed for eighth grade students, was taught by 19 teachers during the 1966-67 school year. It gives an overview of the nature of industry and how it operates and introduces the student to the concepts of industry and their interrelationships. The second-level course, for 10th grade students, is being developed with the objective of helping them attain a more sophisticated understanding of the concepts of industry, and a proposed third-level course for 12th grade students will allow them to specialize in one or a related cluster of concepts. The evaluation procedures of the Project were designed to generate descriptive data on the activities of the Project and comparative data related to achieving the objectives of the courses taught in the cooperating secondary schools. Three specific domains of data appear to be the appropriate concern of Project evaluation: (1) ingredients all factors brought to the learning situation, (2) processes, teaching acts, learning activities, and school organization, and (3) products, the student and teacher outcomes such as skills, attitudes, and knowledge. THE AMERICAN INDUSTRY PROJECT:

DEVELOPMENT AND EVALUATION

I. Development and Present Status of American Industry

During recent years, there has been an increasing awareness of the many ramifications of the technological changes taking place in industry. New, more sophisticated jobs are emerging to take the place of those requiring less skill. Workers can no longer plan on remaining in one job during their working years. Even the man employed in a profession, although he may not change jobs, has to spend considerable time to keep abreast of the latest developments in his area. The pressures of the times have fallen not only on the workers but in turn have borne down upon education to provide the timely knowledges and skills the worker needs to keep pace.

Most technological changes are sequential and have firm roots in the past. Automation represents an extension of mass production. Electronic data processing equipment takes over many of the functions formerly done on less sophisticated machines and also provides greatly increased capabilities to analyze and store information. Thus, if education keeps up to date with contemporary technology, change in the educational realm should also be systematic and sequential.

Unfortunately, there are several built-in mechanisms that tend to keep educational programs behind contemporary technology and knowledge. Such things as the lack of communication between the two worlds of industry and education, the outlook of the teachers, and the financial status of our schools tend to create an educational lag. However, the single largest inhibitor of change in education would appear to be the framework or rationale that provides the justification for each educational program, establishes boundaries for course content, and guides the development of courses within curricula.

Such a rationale is vital to any curriculum. Without one there would be chaos. However, a rationale also brings with it certain restraints on progress. New developments are viewed and analyzed in terms of the existing rationale; and, as a result, there is a substantial possibility that the essence of change may be missed. To illustrate this point, consider the nature of industrial arts. Its rationale emphasizes the learning of specific processes and techniques as an avenue to prevocational training and the development of a knowledge of industry.

Fifty to sixty years ago this rationale had considerable utility. However, as new materials and processes were developed and industry evolved into its present intricate form, this rationale has encountered increasing problems in accounting for the contemporary state of industry. Only so many courses can be fitted into a school curriculum and the proliferation of materials, for example, makes it impossible to include a course on each material, as had been done with woods and metals, or on the processes associated with each new material.

This was the situation faced by a number of the staff members at Stout State University in 1962 as they surveyed the existing industrial arts curriculum. After extensive study, this group delineated the following precepts for a rationale for the curriculum now entitled American Industry.

1. Industry furnishes the content to be studied. Industry in this context refers to an institution in our culture which, through the application of knowledge and the utilization of men, money, machines, and materials, produces goods or services to meet the needs of man, and which results in a profit for the institution or society.
2. In order to study industry, the diverse knowledges, activities, and functions encompassed in this realm have to be organized. Thus, there is need for the identification of a structure of industry.

3. Transfer of learning is a composite of identical elements and mental set.

   A. Therefore, concepts[1] learned through encounter with specific situations provide the most logical and effective elements to be learned in the study of industry.

   B. Therefore, a conceptual structure of industry should be developed to organize the concepts of industry.

Directed by these precepts, the members of this study group pursued the study of various structures. One of the major findings of this research was the discovery of the interrelated nature of all the concepts derived for the structure of industry. As a result, the group decided to depict the structure as a "ball" with fourteen sides. Each of the major concepts of industry was located on the periphery of the "ball" at a point formed by the intersection of two sides. The interrelations among the concepts are shown by the lines connecting the fourteen concepts with each other. A graphic illustration of this structure is given on the next page.

Another basic tenet of the Stout study group was that classroom teachers should be involved at an early stage in the design and implementation of this new program. With the aid of a grant from the Ford Foundation, ten industrial arts teachers were brought into the curriculum project which had, by this time, been christened the American Industry Project. These ten men worked with the co-directors, Wesley Face and Eugene Flug, during the summer of 1964 to develop the first course in American Industry.

---

[1]The working definition employed by the Project

> . . .describes a concept as a psychological construct resulting from a variety of experiences (detached from the many situations giving rise to it), fixed by a word or idea, and having functional value to the individual in his thinking and behavior (Face and Flug, 1965, p. 10).

A CONCEPTUAL STRUCTURE OF THE KNOWLEDGES NECESSARY TO UNDERSTAND AMERICAN INDUSTRY

672 C

Sufficient promise was evident during the 1964-65 school year to warrant a four year grant from the United States Office of Education. This grant enabled the American Industry Project to expand to twenty teachers in fourteen different schools. The scope and nature of the project did not permit a rigid sampling in the selection of schools and teachers. However, a large city school system was contacted and agreed to cooperate with the American Industry Project. This gave a range of schools from a small rural town to a large urban area. With the inclusion of the large city system, the Project had a school representing each level in Project TALENT's School Taxonomy (Dailey, 1962, Ch. 4, p. 13).

The U. S. O. E. grant also provided funds for additional staff members. A curriculum specialist was hired to plan instructional units, teacher materials, and student booklets. The talents of an audio-visual media specialist were acquired to create instructional aids. Feedback on the effects of the units of study and instructional materials was needed. To accomplish this, two people were added to the staff. One visits the participating centers, observes the American Industry classes, and discusses the progress of the course with the participating teachers. The second man functions as a research specialist with responsibility for constructing needed evaluation forms and supervising the analysis and reporting of the resulting data. The other man added to the American Industry staff has responsibility for the development of a pilot teacher education program at Stout. In 1969, there will be twelve graduates from this program.

Course materials are being developed and evaluated by the Project staff and participating teachers in light of two general objectives:

1. To develop an understanding of those concepts which directly apply to industry.
2. To develop the ability to solve problems related to industry.

Each instructional unit has objectives stated in behavioral terms which emanate from these two primary objectives.

The first course in American Industry gives an overview of the nature of industry and how it operates. Students are introduced to the concepts of industry and some of the interrelationships among them. They also have an opportunity to start and operate their own business. Through this business they become aware of the fact that poor workmanship (processes concept) can reduce sales, (marketing concept) and as a result lower profits (finance concept).

The major goal of the first level course is to build a general knowledge of the conceptual structure of industry, develop the ability to solve problems related to industry, and create an understanding of the relationship of industry to the lives of all members of our society. Thus, students in this course study processes rather than specific skills, and materials in place of woods or metals. In addition, they are exposed to such concepts as research, finance, management, and communications.

The first level course is being taught by nineteen teachers during the 1966-67 school year. Each teacher has been provided with an instructor's guide that details the learning activities and the sequence of instructional units. A set of seven booklets is provided for each student. At the end of the class term, each class is evaluated by the Project and compared to control classes which are not exposed to American Industry.

Four teachers are doing developmental work on the second level course. These men outlined a series of units for the course during the project's 1966 summer workshop. Now, they are trying out their ideas and keeping a record of what works and what needs to be revised. The objective of the second level course is to attain a more sophisticated understanding of the concepts of industry.

The American Industry Project also proposes a third course in which students could specialize in one or a related cluster of concepts. For example, a student might concentrate on the concepts of research, materials, and processes in order to acquire a better comprehension of these concepts and at the same time determine what process can be used with specific materials. This course will involve as much independent study as each student can profitably undertake.

Suggested grade placement of these three courses is Level I in grade eight, Level II in grade ten, and Level III in grade twelve. This represents the grade levels for which the student materials are being prepared. However, several of the participating teachers are teaching Level I in the tenth and eleventh grades with success.

The previous pages have given a general overview of the genesis, development, and present nature of the American Industry Project and its program. Anyone who desires to carefully analyze and evaluate this program should also read The American Industry Project and the Project's proposal to the U. S. O. E. Both of these reports are vital to a complete understanding of what the American Industry Project is attempting to accomplish. (These reports are available from the American Industry Project on request.)

As you read the previous pages you were probably aware of the fact that the American Industry approach differs considerably from industrial arts. This should be expected with the adoption of a new rationale. The initial pages noted that a rationale was necessary but that it also contained a certain resistance to change. Development of a rationale requires considerable effort which results in a certain amount of ego involvement. Discarding a rationale requires that its proponents give up the fruits of this labor, the basic principles that guide their work, and acquire an entirely new set of precepts. This process is

neither easy nor quickly accomplished. As a result, the prevailing rationale is modified and adhered to until it comes to a point where it obviously fails to provide the guidance necessary for the discipline to maintain its status.

The situation that provides the catalyst for a new rationale will have many of the dimensions of a crisis. Furthermore, the new rationale will have to account for all of the changes in knowledge and skill accomplished since the old rationale was formulated. Hence, one should expect the change of a new rationale to be somewhat drastic.[2]

Since a change in rationales has many disruptive effects, there may be some question as to whether the development and utilization of a rationale are worth the cost in time and controversy. However, without a rationale, explicit or implicit, a discipline cannot help but flounder from lack of direction and wither from lack of unified effort on the part of its members. A logical rationale is a basic necessity to a dynamic discipline. What the educator has to be cognizant of is the fact that periodically there will be a need for a new rationale and that the resulting change will have some disruptive aspects.

The preceding pages have given an insight into the objectives and scope of the American Industry Project. The ensuing section will discuss the evaluation procedures utilized by the Project.

---

[2]One does not have to be the author of a rationale in order to be reluctant to give it up. Remember that considerable time is expended in learning the rationale before one is allowed to practice it.

II. Evaluation

The evaluation procedures employed by the American Industry Project were designed to generate several types of data. First, there was a need to obtain descriptive data on the activities which emanated from the Project. These descriptive data provide feedback information which is essential for making many of the decisions connected with the daily and long-term functioning of the Project. In addition, these descriptive data accumulate to form a history of the events accomplished. This history provides an important source of information for assessing the extent of agreement between the activities devised to reach the group's objectives and what actually transpired.

The second type of information required was comparative data related to the achievement of the objectives of the American Industry courses taught in the secondary schools cooperating with the Project. Students encounter many learning experiences both in and outside of school that might have some influence on their knowledge and understanding of industry. Thus, the magnitude of the effect that results from the formal study of American Industry has to be assessed in relation to students who are not in these courses. Control groups were secured to provide a basis for making these comparisons. Since the research design will be described in further detail later in this paper, additional comments on it will not be made here.

Now that the general uses of information pertaining to the Project have been identified, attention can be focused on the sources of these data. Three specific domains of data appear to be the appropriate concern of the American Industry Project. These three domains have been entitled. "ingredients," "processes," and "products" in this paper.

Scope of the Evaluation

"Ingredients" refers to all of the factors brought to the learning situation by the several agents involved. An initial factor is the instructional materials designed for the American Industry curriculum. These materials include resource books for the teachers, the teacher's guide, and the student materials. Since these materials are based on the structure of industry and the concepts derived by the Project, this structure and the concept models also have to be evaluated and verified.

Characteristics of the students to which American Industry is taught represents another ingredient. Their abilities, interests, and knowledges will have considerable influence on what is accomplished. In like manner, the nature of the teacher will play a vital role, and, thus, it forms another ingredient. Finally, the school and the community in which it functions will exercise considerable influence. Such factors as the monetary resources of the community and the educational philosophy of the school have a marked effect on any educational program and especially on an experimental one.

The "processes" domain encompasses the teaching acts, learning activities, and school organization imposed on the ingredients for the purpose of accomplishing a set of objectives. This category refers to ongoing activities entailed in the study of American Industry in the secondary schools. It focuses on the dynamics of the classroom situation and the interactions among the ingredients involved in establishing and teaching a class in American Industry. Thus, the actions of a reticent department head are as much a part of this domain as the interaction between teacher and students during a class discussion.

"Products" forms the last domain for the evaluation and it embraces the outcomes of the study of American Industry. Student knowledges, understandings, skills, attitudes, and interests are facets of this area. In addition, the

attitudes and knowledges of the American Industry teachers constitute attributes worthy of evaluation in this realm.

Figure 1 is presented below to give a clearer conception of the relationship of these three domains in the evaluation of the American Industry Project. Note that the horizontal arrows connect the "ingredients" to the "products" to graphically indicate the role of the "processes." The vertical arrows denote the possible interactions among the processes.

Figure 1

FACTORS ENCOMPASSED IN THE EVALUATION OF THE AMERICAN INDUSTRY PROJECT

Evaluation Instruments and Procedures

Ingredients. First drafts of the American Industry Project's structure of industry and the models for the concepts in this structure were distilled through an extensive and detailed review of literature. Once this had been done, the structure and models were submitted to a number of individuals associated with industry. These consultants to the Project were employed in a variety of service and production industries. Each consultant received the structure and a model and gave his evaluation of them. Several educators closely associated with industry were also contacted.

It is important to note that a variety of industries are represented in this sample. The Project was interested in defining concepts that were

representative of all types of industries. In order to do this, the criticism, thoughts, and ideas of people with assorted vocational experiences were solicited.

Even though a heterogeneous sample of industrial people was contacted, the Project was also committed to developing a unified discipline centered on the study of industry. Observe that this paper refers to the study of industry and that the curriculum has been entitled American Industry. The singular case used in these titles reflects a basic tenet of the Project which holds that the major ideas utilized in individual American businesses are similar enough to be effectively and efficiently studied as a part of one unified structure. For example, the basic ideas in management are the same whether you operate a retail store, manage a large factory, or run a farm.

To accomplish a unified structure, the Project staff studied the verbal and written comments of the consultants. As new insights were obtained, they were incorporated into revised editions of the concept models. These revisions were then submitted to additional consultants. The Project intends to continue this process of consultant evaluation in order to refine the structure of industry and the concept models and keep them current with the best thinking in industry.

During the past three years, the participants in the American Industry Project have developed a number of teaching materials. The teacher resource books and lesson plans are evaluated through the comments and suggestions made by the participating teachers. A reporting form has been distributed to the teachers for use in giving their general impressions of these materials. Specific comments are made in the material at the point they apply. After an instructional unit is completed, the materials for the unit are returned to the Project where the comments are recorded and analyzed.

The student booklets written for the American Industry courses are evaluated through student and teacher comments. Each student completes a rating scale on each booklet. Responses to statements on the reading level, content, degree of interest in the material, and format of the booklet are requested. The reading level comments will be compared with the student's reading ability and the reading level of the book as measured by the Dale-Chall formula (Dale and Chall, 1948).

American Industry students are encouraged to make specific comments in their booklets and to underline words they do not comprehend. Observations by the participating teachers are also requested. As the teachers read the booklets in preparation for presenting the lessons, they are watchful for errors of commission and omission.

Information related to the education, work experiences, and teaching experiences of the participating teachers was collected through the use of a questionnaire completed when applications for the teaching positions were made. Further background information was obtained from interviews with the applicants and a review of their college records. After the teachers were selected, their teaching competencies were strengthened through a series of micro-teaching sessions (Bush and Allen, 1964). During these sessions, the teachers presented five to ten minute American Industry lessons to groups of four or five junior high school students. These students rated their teacher. Then, the video tape of the session was played back to the entire Project staff. As the playback was viewed, the staff completed the Stanford Teacher Competence Appraisal Guide (Stanford University School of Education). One copy of the Appraisal Guide was given to the teacher and one copy was retained for the Project's files. After the video tape had been viewed, the micro-teaching session was discussed by the group and suggestions were given for improving the presentation.

Several types of data are collected on the participating students. Each student involved in the evaluation of an American Industry course answers a series of items which pertain to his interests, work experience, family background, and school experience. Most of these items were selected with Project TALENT's permission from the Student Information Blank (Flanagan, Davis, Dailey, Shaycoft, Orr, Goldberg, Neyman, 1964, Ch. 5). In addition, the participating schools release the standardized achievement and ability test data to the American Industry Project. This information provides a good description of the student's ability, achievement, social-economic status, experiences, and interests.

In those schools in which the experimental and control classes cannot be composed by random selection, the students are pretested on their knowledge of industry. When pretesting is done, one-half of the students receive the test developed by the Project to measure knowledge of industry and the others take a test based on industrial arts content. The two tests are randomly distributed to the students being tested. This procedure permits a determination of the degree of reactivity associated with the pretesting.

Information on school characteristics is obtained from several sources. The participating teachers submit copies of their teacher handbooks, class schedules, and student handbooks. They are also required to complete a questionnaire which contains items selected from Project TALENT's School Questionnaire (Dailey, 1962, A1-A10). These items pertain to the students' education aspirations, the financial status of the school, and the educational program offered. Further information on the schools comes from photographs and reports from the Project's staff members who have visited the schools.

Descriptions of the communities that support the participating schools are written by the teachers. To supplement this, the Project obtains phone books and city directories for these communities. In some instances, literature or brochures developed by civic or business organizations are also available.

Processes. Direct observation of the American Industry classes by Project personnel provides the basic data for evaluating the processes involved in the study of American Industry in the secondary school. Use of the Stanford Teacher Competence Appraisal Guide produces a systematic and consistent set of observations on each participating teacher. This rating scale directs the observer to consider the aims and planning encompassed in a lesson and the quality of the presentation. The Appraisal Guide also focuses the attention of the observer on the interactions between the teacher and his class. Pupil-teacher rapport, pupil participation, and the pacing of the lesson are rated.

The last section of the Appraisal Guide concerns the relationship between the participating teacher and the other staff members in his school. Specific items in this section deal with the teacher's concern for the total school program and the work of his colleagues. Ratings on this portion of the scale are made on the basis of the observer's conversations with the participating teacher, administrators, and other staff members in the school. Frequently, the observer will have an opportunity to view teacher-administrator and teacher-teacher relationships in formal meetings or in informal sessions in the faculty lounge.

In addition to completing the Appraisal Guide, the observer records general comments on the classes observed and the school environment. The progress of the American Industry classes is noted and the lessons studied during the visit are recorded.

Additional information on the teaching acts and learning activities accrues in the lesson plans and comments made by the participating teachers. Also, the rating scale for the student booklets requests the students to indicate the extent of their utilization of the booklets. A more subtle measure of the usage of the booklets is the extent of wear evident on the booklets.

All of the data in this realm reflect the degree of success achieved with the materials and lesson plans developed by the Project. Furthermore, they indicate the extent to which the original lesson plans and course plans were followed by the participating teachers.

Products. Several products are of primary interest in the evaluation of the effects of the study of American Industry. Immediate feedback is received from an achievement test constructed by the Project. This test presents sample industrial problems to the students along with more factual items. Several items which assess the ability to think conceptually about industrial situations are also included. This test was constructed to measure the objectives delineated by the American Industry Project. The achievement test will also be administered to a sample of industrial employees to ascertain if it distinguishes between the adaptable and successful workers and those who receive low performance ratings.

Student reactions to the American Industry courses are requested on a free response form patterned after a questionnaire designed by Gump (1965). The first part of the form asks the students to rank the courses they like and give the reasons for their attraction to the courses. In the second part, the students rank the courses they dislike and state their reasons for disliking them.

Egan found that the 1965-66 American Industry students "liked" their American Industry course as much as the other courses in their class schedule. (Egan, pp. 33-34). However, he also received significantly fewer negative rankings and comments related to the American Industry courses. In the last part of his questionnaire, Egan asked each student to relate what he liked and disliked about the American Industry course in which he was enrolled. In brief,
